

The KSC-JCS Joint Symposium  
Busan, Korea, April 16, 2010

# Significance of Nitric Oxide Synthases (NOSs) in the Cardiovascular System - Lessons from Mice Lacking All NOSs -

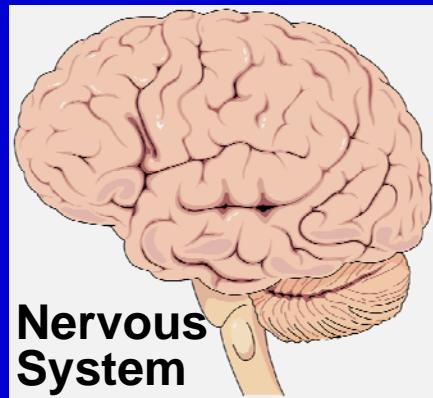

<sup>1</sup>Department of Pharmacology, University of the Ryukyus, <sup>2</sup>Department of  
Cardiovascular Medicine, Tohoku University, and Departments of  
<sup>3</sup>Pharmacology and <sup>4</sup>Internal Medicine, University of Occupational and  
Environmental Health, Japan

Masato Tsutsui,<sup>1</sup> Hiroaki Shimokawa,<sup>2</sup> Nobuyuki Yanagihara,<sup>3</sup>  
Yutaka Otsuji<sup>4</sup>

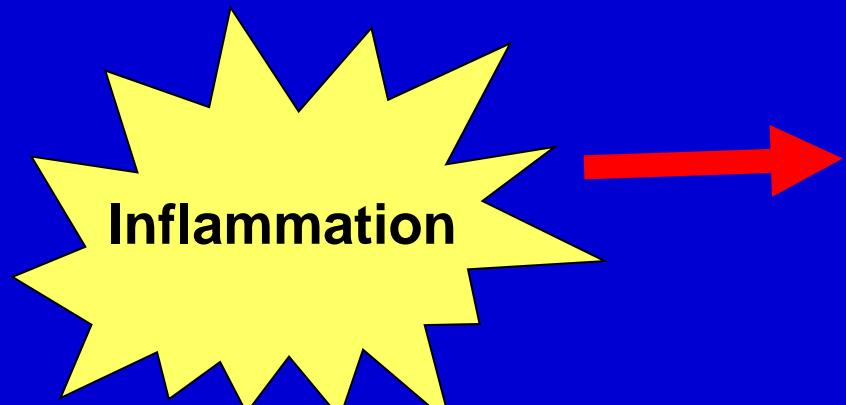

# Significance of Nitric Oxide Synthases (NOSs) in the Cardiovascular System - Lessons from Mice Lacking All NOSs -

1. Vascoprotective role of nNOS
2. NO-independent long-term vascular action of L-arginine analogues
3. Cardiovascular phenotypes in mice lacking all NOSs

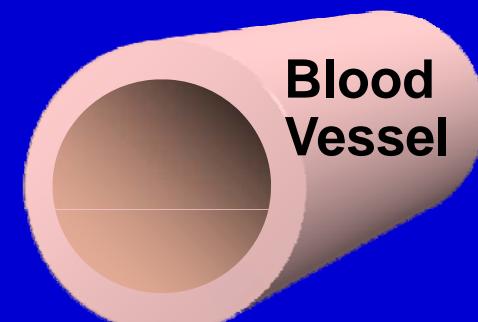

# The Nitric Oxide Synthase (NOS) System

Neuronal NOS (nNOS)

Inducible NOS (iNOS)

Endothelial NOS (eNOS)

# Role of Each NOS Isoform in Vascular Lesion Formation

## eNOS

eNOS-KO mice/Carotid artery ligation model (*JCI* 1998)

→ Vascular lesion is exacerbated

eNOS-TG mice/Carotid artery ligation model (*ATVB* 2001)

→ Vascular lesion is ameliorated

eNOS plays a vasculoprotective role

## iNOS

iNOS-KO mice/Cardiac transplantation model (*Circulation* 1998)

→ Vascular lesion is exacerbated

iNOS-KO mice/Carotid cuff placement model (*Circ Res* 1999)

→ Vascular lesion is ameliorated

iNOS has dual roles

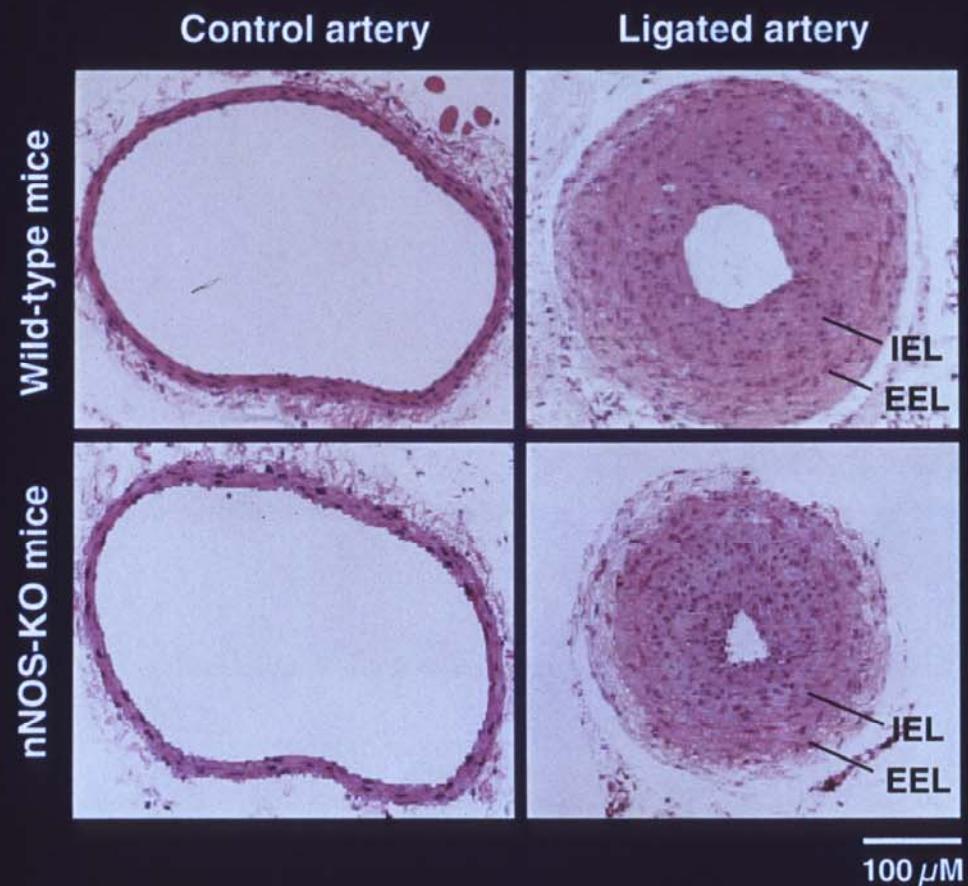

## nNOS

Role of nNOS is unknown

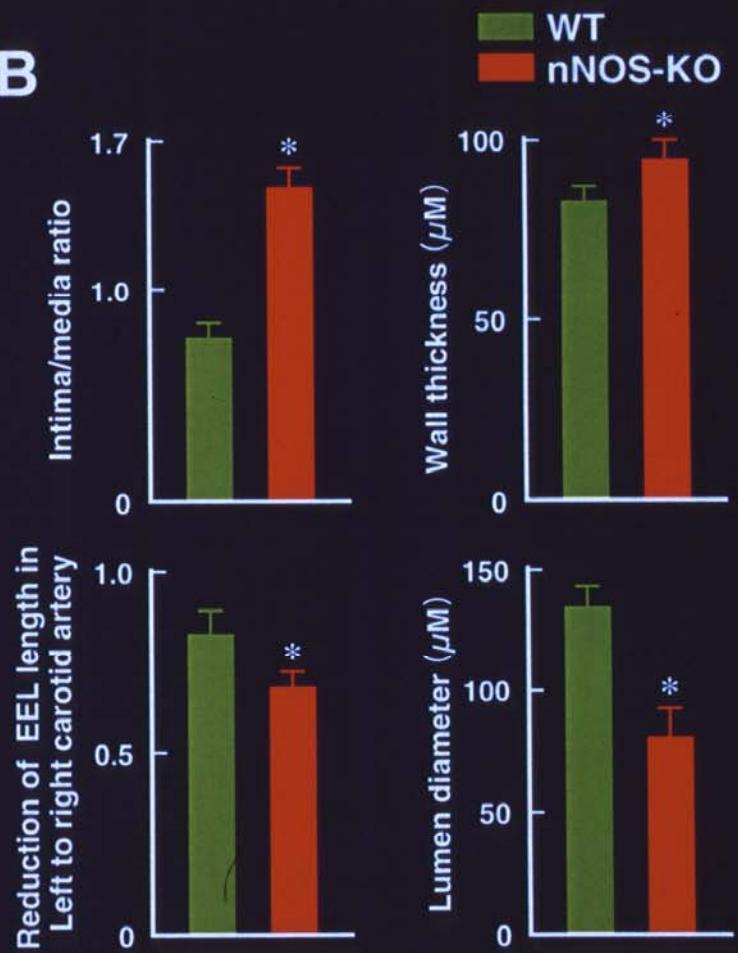

# Vascular Lesion Formation in Wild-Type and nNOS-KO Mice at 4 Weeks After Carotid Artery Ligation
