KOREA UNIVERSITY MEDICAL CENTER

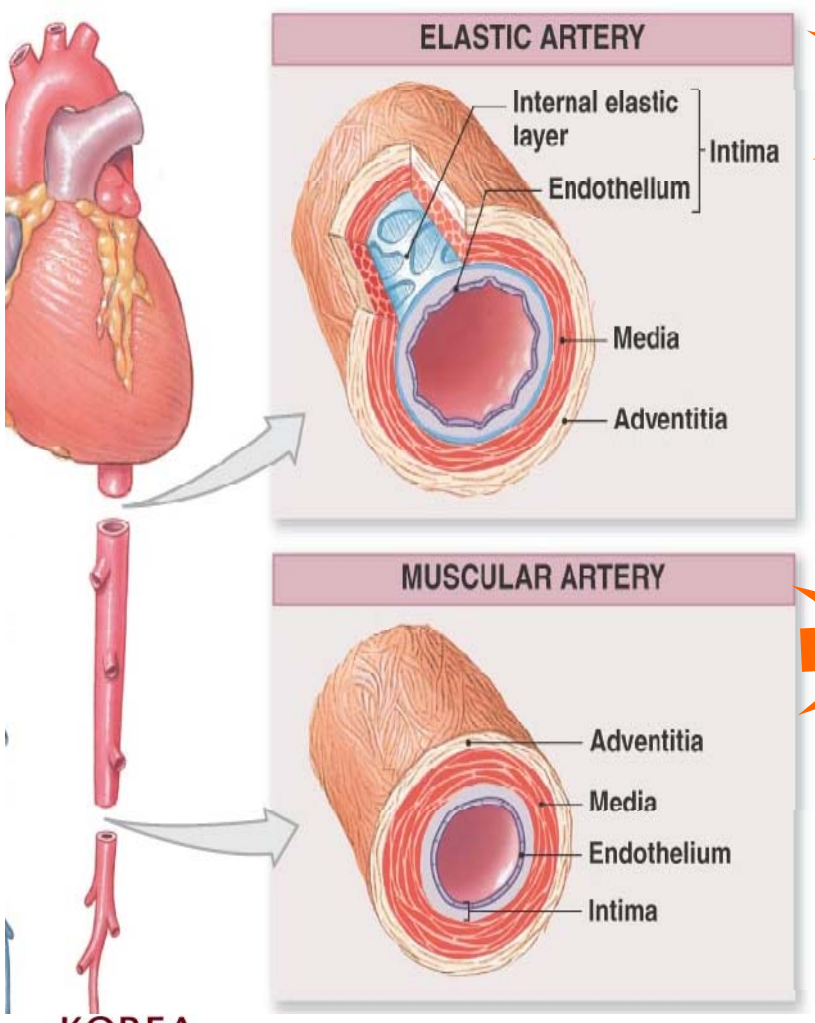
Central vs. Peripheral artery



- **Central artery**

  :aorta, carotid artery

- **Peripheral artery**

  : brachial, radial artery

KOREA UNIVERSITY MEDICAL CENTER

Central Vs Peripheral Artery

VESSEL TYPE/ ILLUSTRATION*	AVERAGE LUMEN DIAMETER (D) AND WALL THICKNESS (T)	RELATIVE TISSUE MAKEUP
 Elastic artery	D : 1.5 cm T : 1.0 mm	
 Muscular artery	D : 6.0 mm T : 1.0 mm	
- **Elastic (conducting) arteries**
  - more elastic fibers,
  - less smooth muscle
  - lose elasticity with aging
- **Muscular (distributing) arteries**
  - deliver blood to most organs
  - more smooth muscle cells
  - fewer elastic fibers

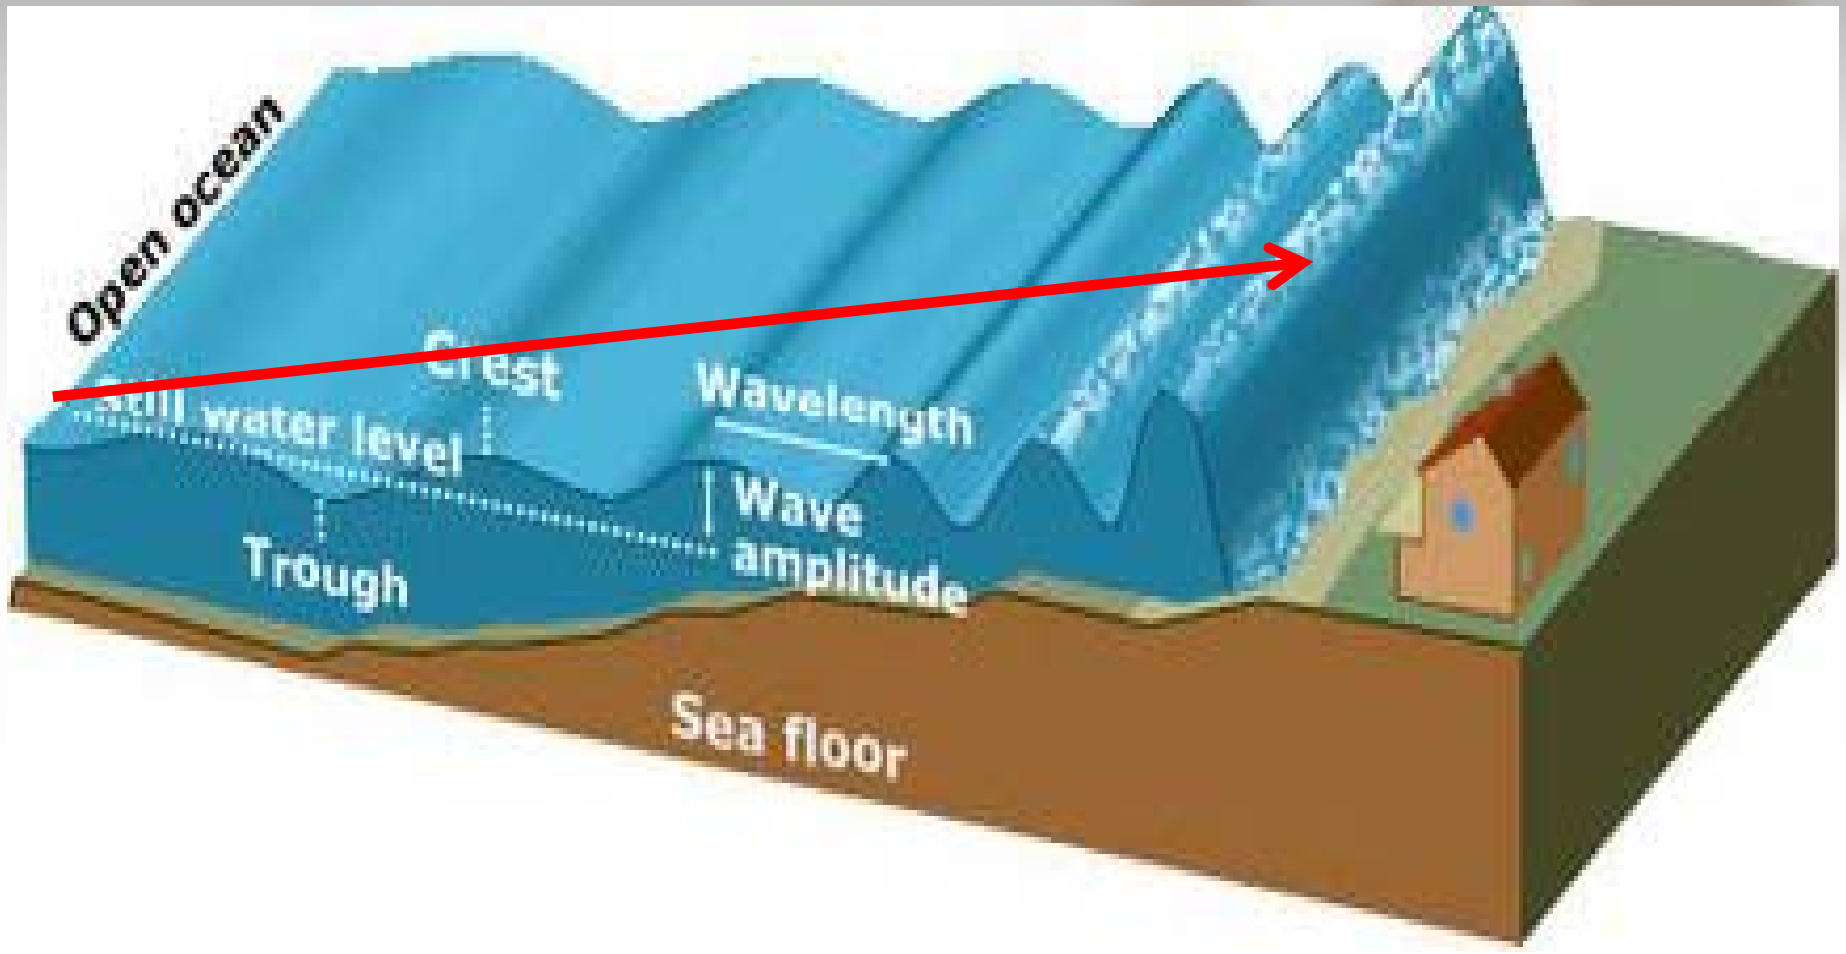
Blood Pressure Amplification



KOREA UNIVERSITY MEDICAL CENTER

Blood Pressure Amplification

8 m/sec

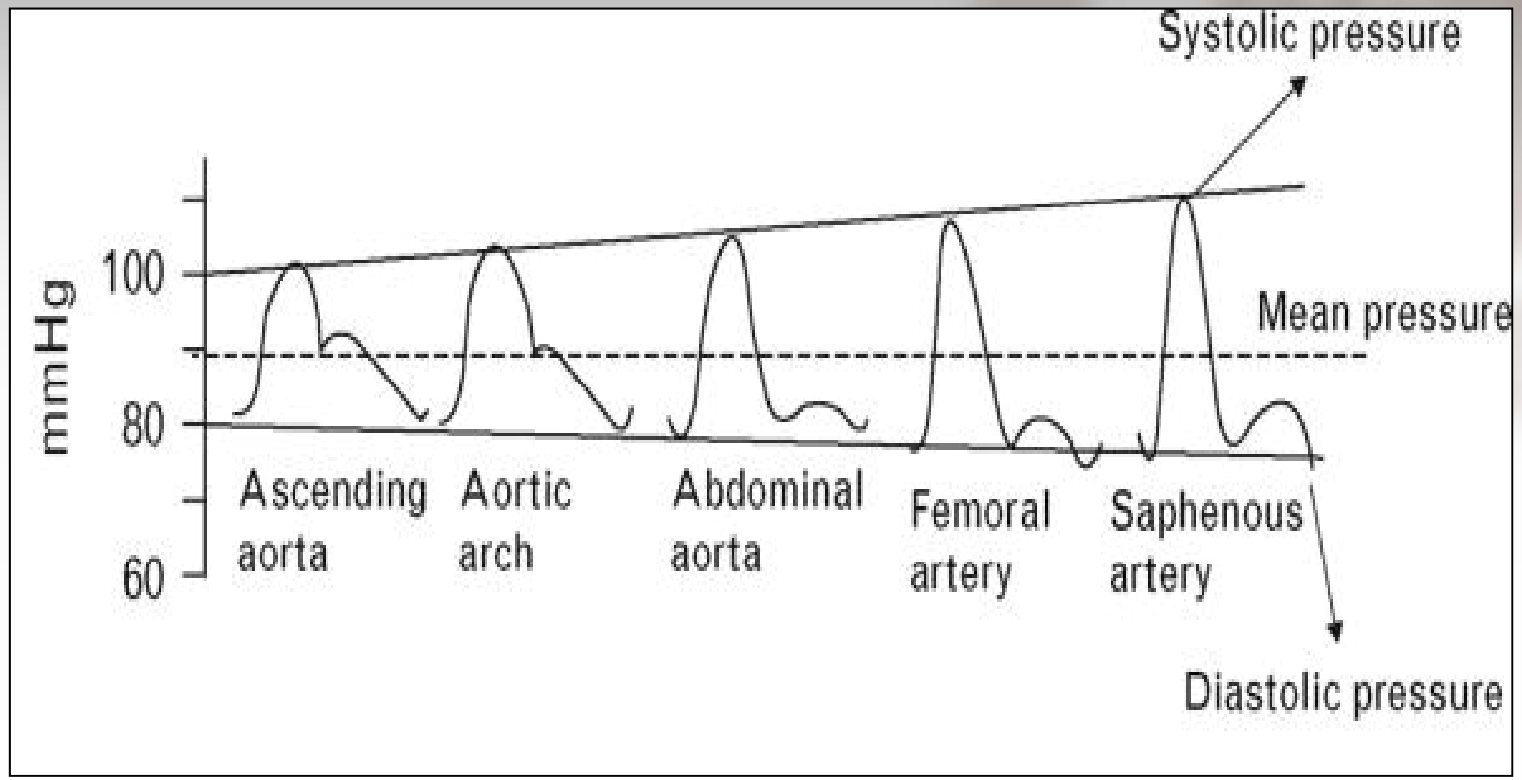
Young normal aorta

12 m/sec

Old stiff aorta

KOREA UNIVERSITY MEDICAL CENTER

Blood Pressure Amplification

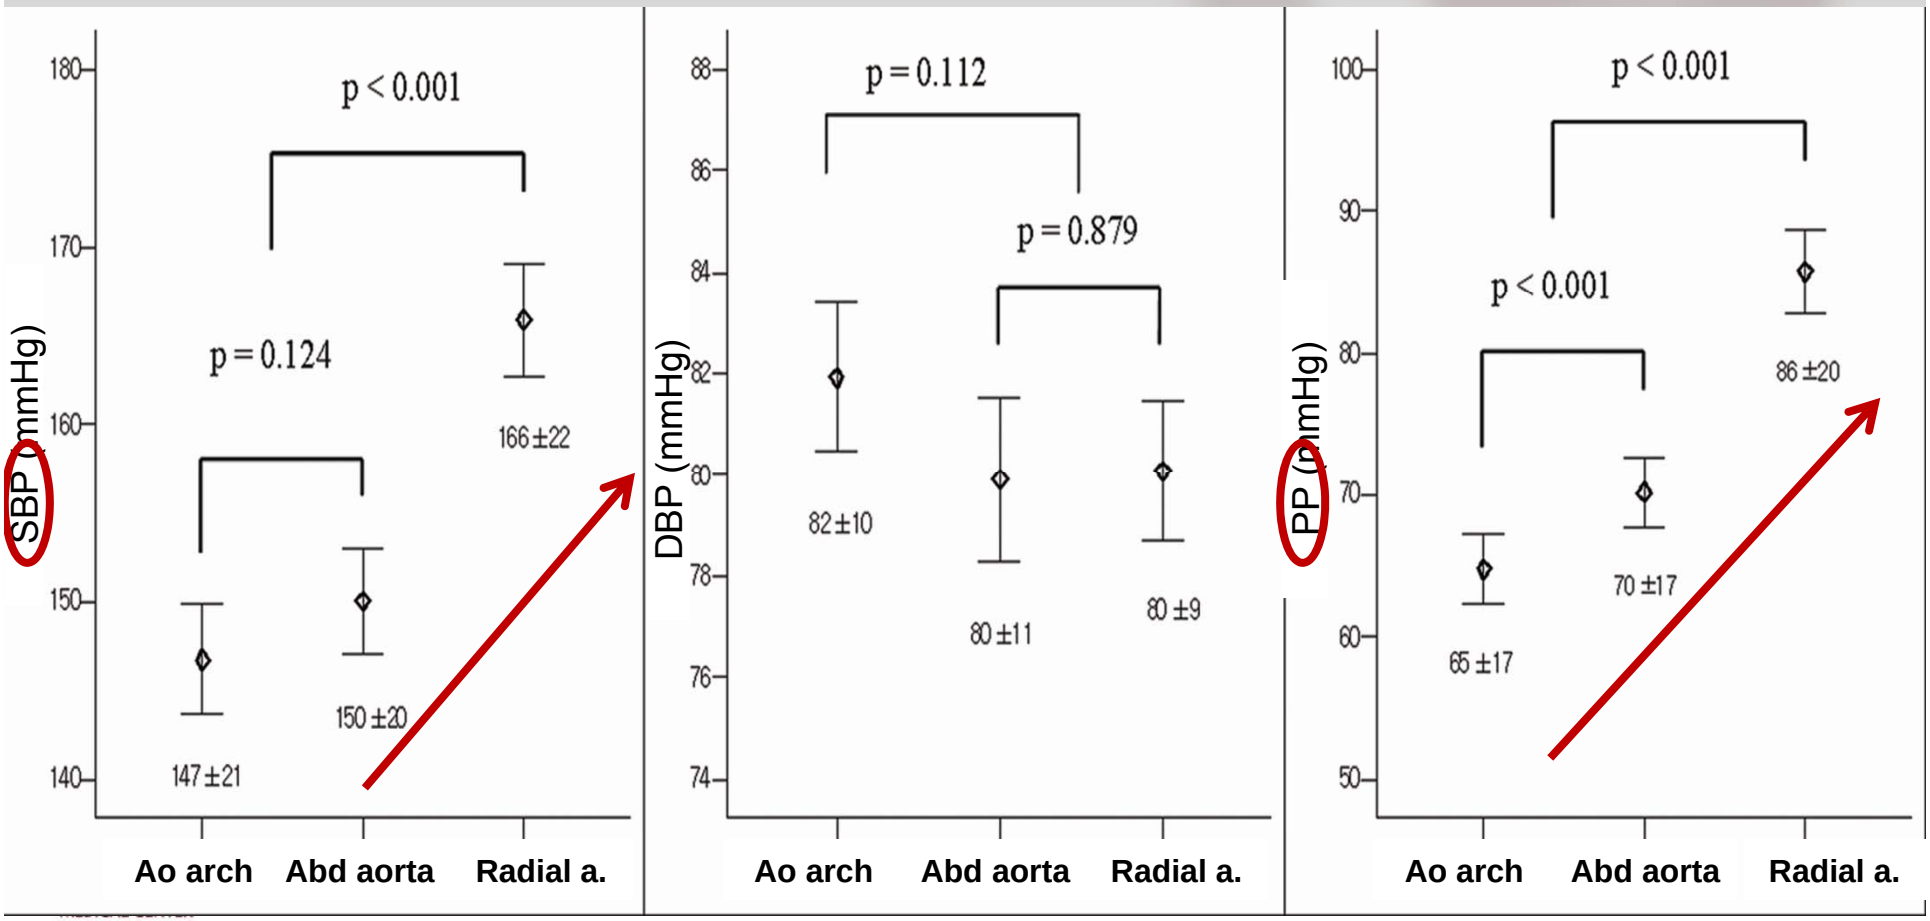


It is a traditional observation that BP waves differ markedly between central and peripheral sites of the arterial bed

KOREA UNIVERSITY MEDICAL CENTER

Journal of Hypertension. 2007;25:265-272

Blood Pressure in Each Arterial Tree.



Choi CU, Kim EJ et al. *J Hypertens* 2010 (In press).

Limitation of Brachial BP

◆ In younger people

- Overestimate the central systolic and pulse pressure

◆ In elderly

- Tachycardia, systolic heart failure, exercise, drug

➔ Difference between brachial pressures and central aortic pressures

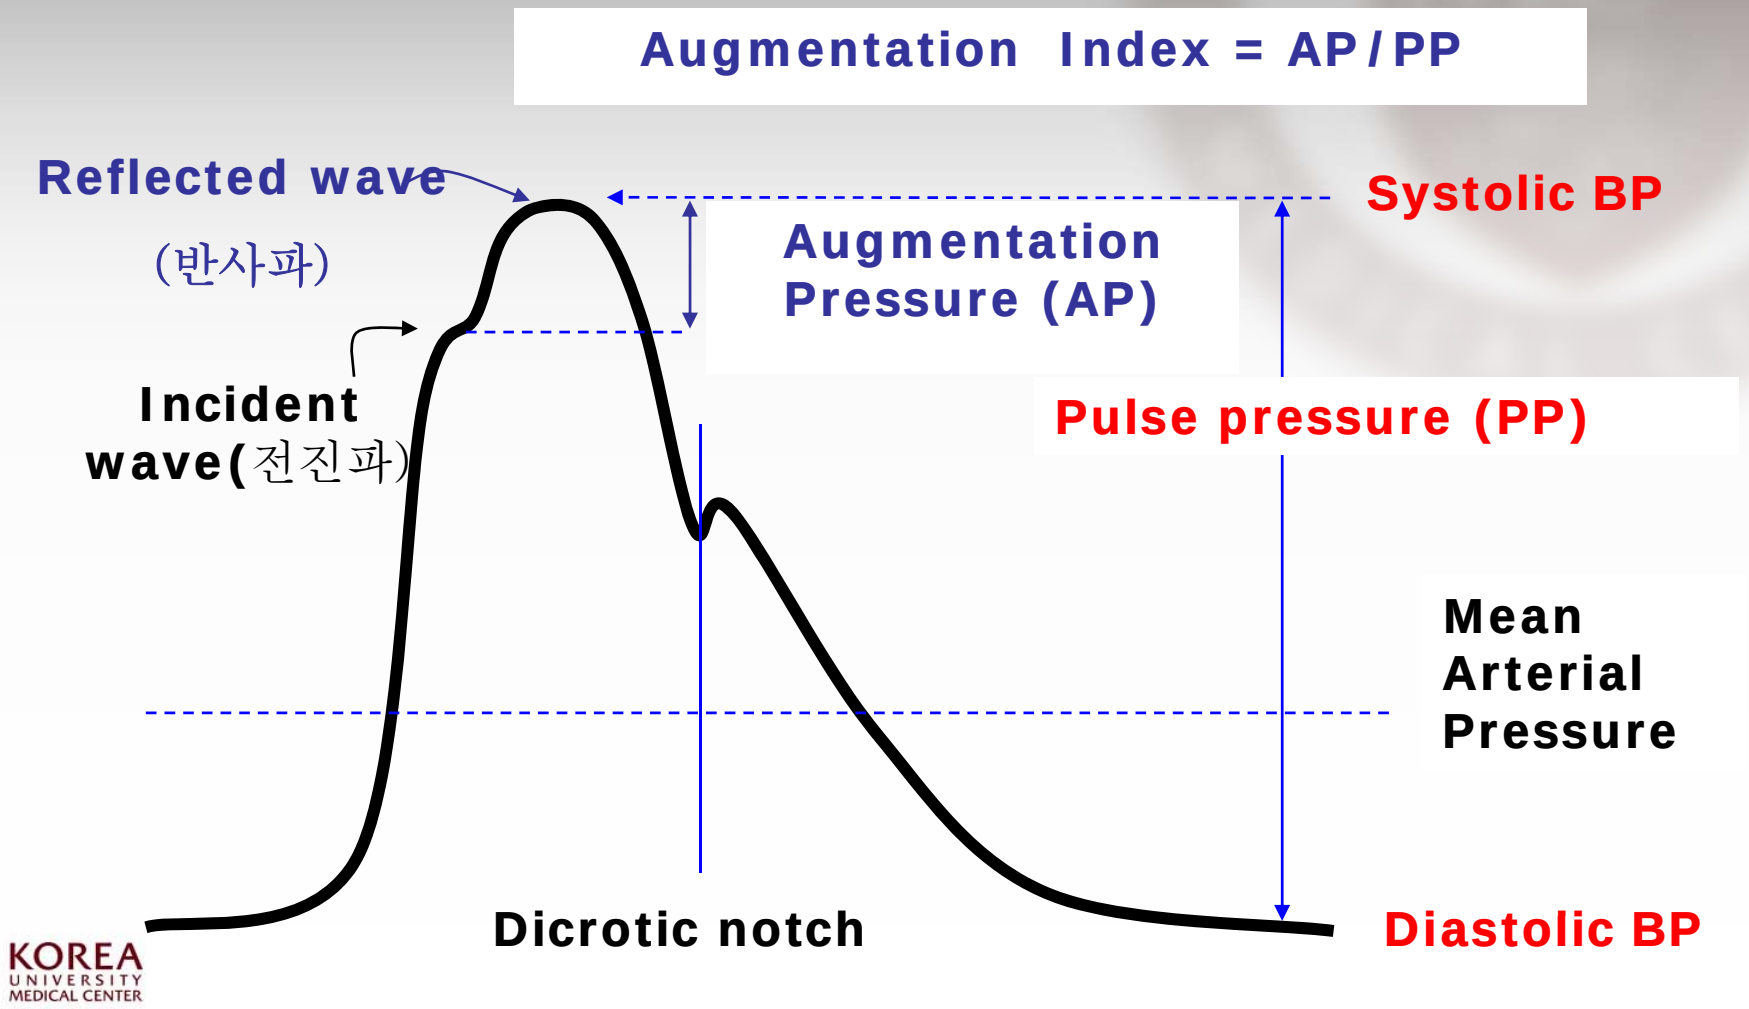
KOREA UNIVERSITY MEDICAL CENTER

KOREA UNIVERSITY GLOBAL PRIDE

Clinical Implication of Central BP

KOREA UNIVERSITY MEDICAL CENTER

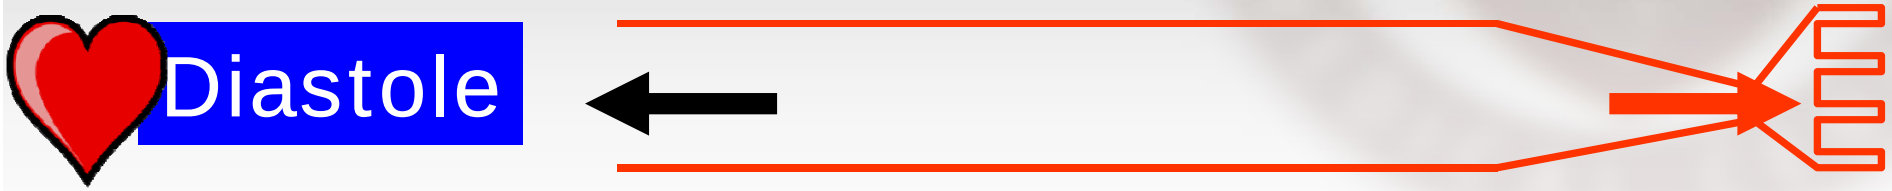
Central Arterial Pulse Wave

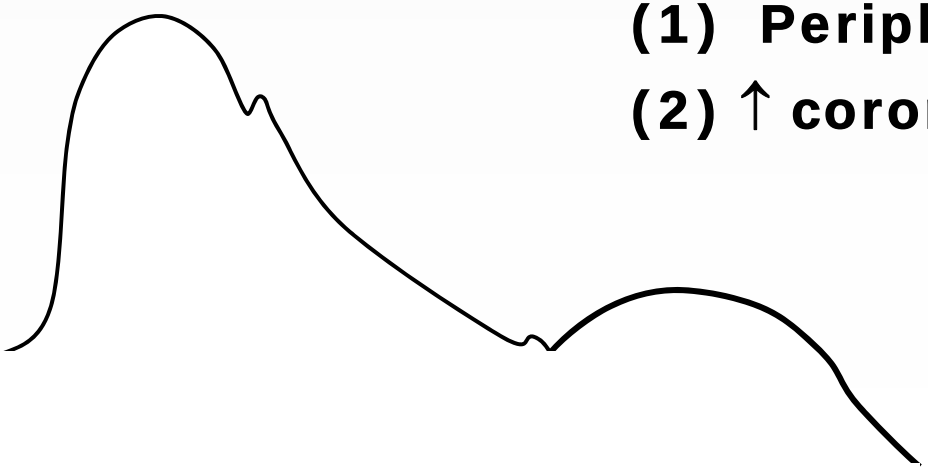


KOREA UNIVERSITY MEDICAL CENTER

Pulse Wave Reflection

Young compliant arteries :
normal PW velocity 8 m/sec





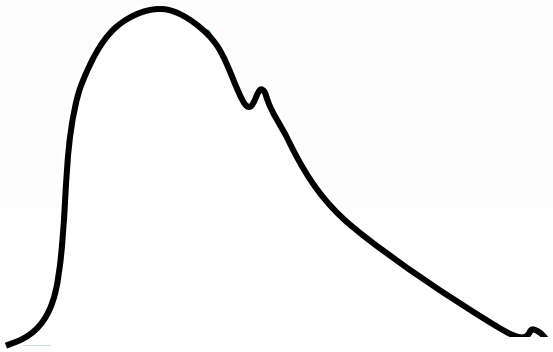
(1) Peripheral amplification

(2) ↑ coronary blood flow

KOREA UNIVERSITY MEDICAL CENTER

Pulse Wave Reflection

Elderly stiff arteries with ISH : increased PW velocity 12 m/sec

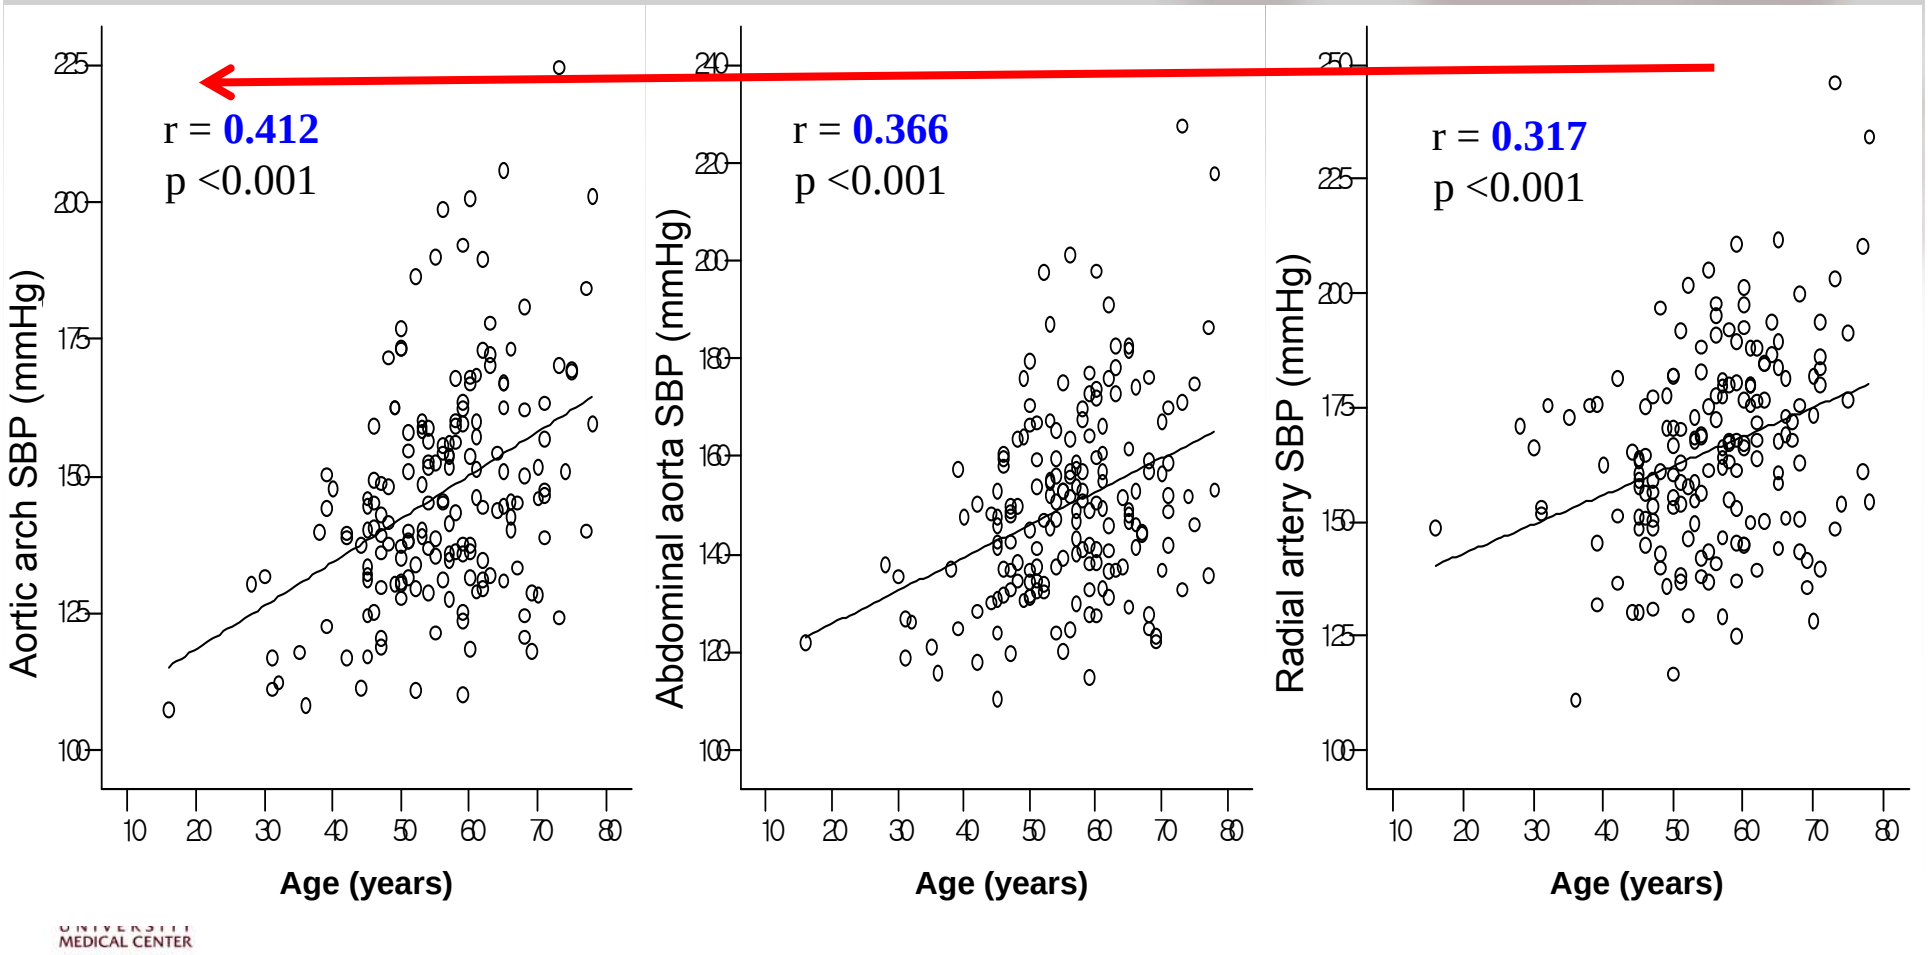


KOREA UNIVERSITY MEDICAL CENTER

(1) Ventricular-vascular mismatch

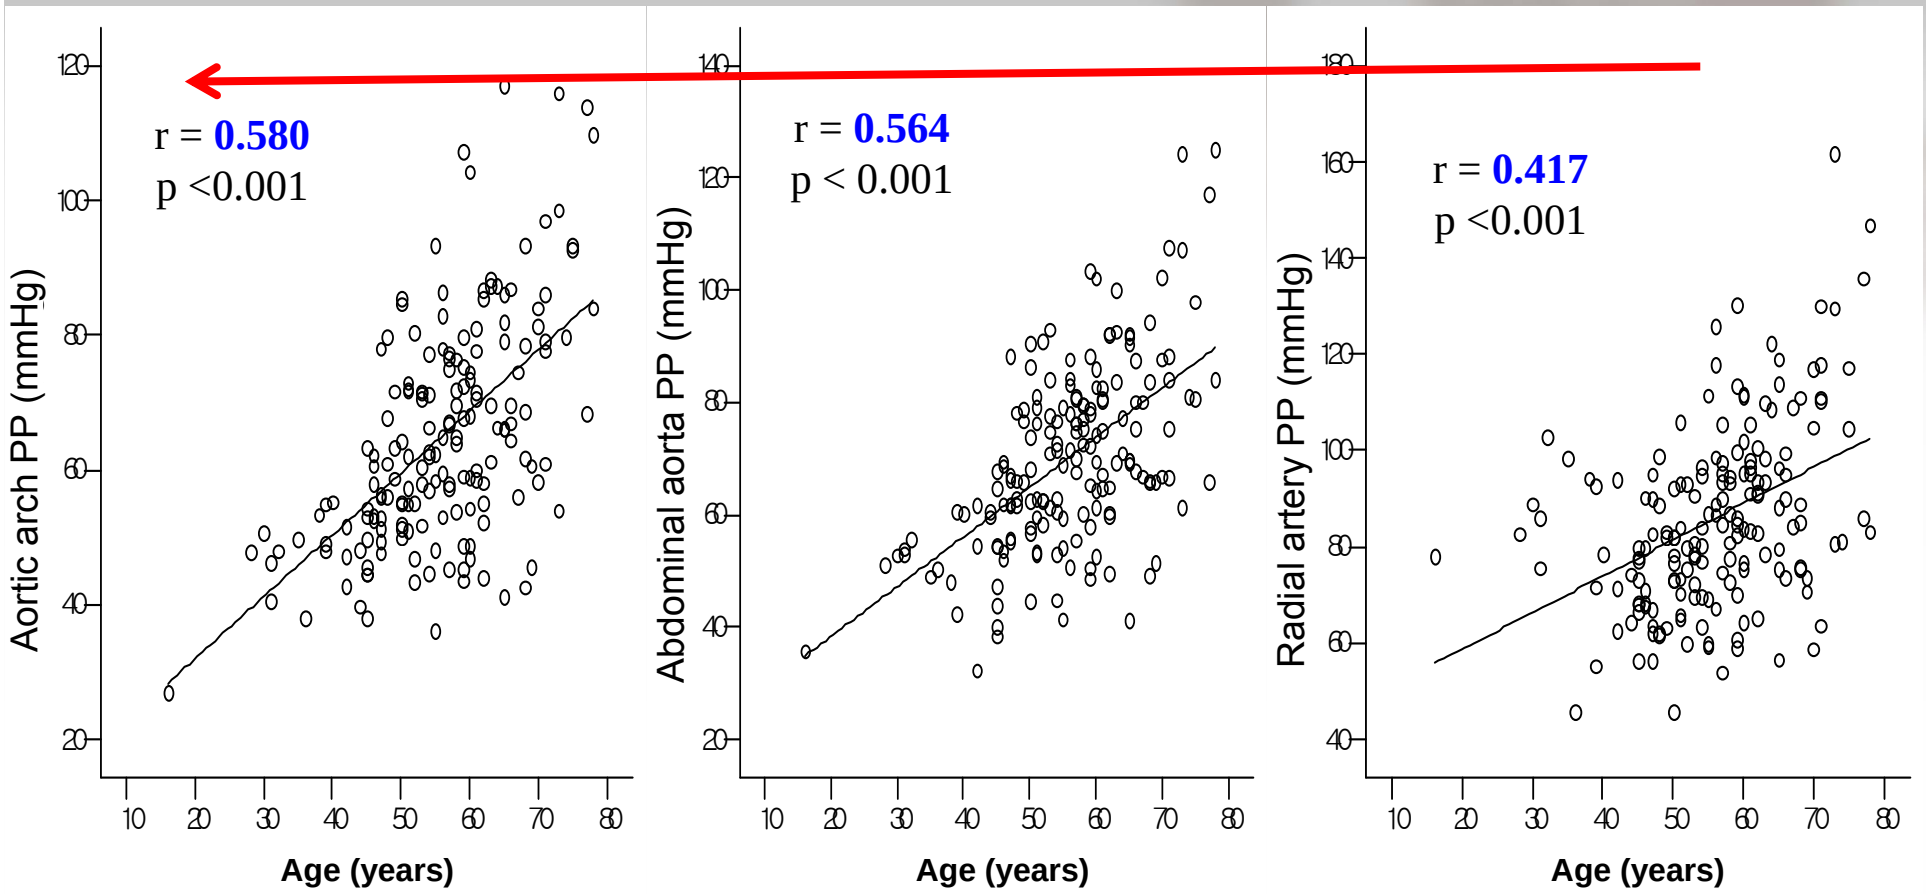
(2) The reflected wave augments aortic BP in late systole

Correlation between Ageing and SBP in Each Arterial Tree



Choi CU, Kim EJ et al. *J Hypertens* 2010 (In press).

Correlation between Ageing and PP in Each Arterial Tree



KOREA UNIVERSITY MEDICAL CENTER

Choi CU, Kim EJ et al. *J Hypertens* 2010 (In press).

Clinical Implication of Central BP

- **Increased Aortic SBP**
  - Increased vascular afterload and developed LVH
  - Decreased coronary perfusion pressure
  - Increased MVO2 and subendocardial ischemia
  - Increased endothelial dysfunction and atherogenesis

Clinical Implication of Central BP "Beyond BP Control"

- **HOPE, LIFE, ANBP2 studies**
- "**Beyond BP control**" are perhaps associated with arterial properties or central BP

Appropriateness of Measuring Central Pressure

- Brachial BP is not the perfect surrogate for central BP

- Central BP should be more closely related to the pathophysiology of cardiovascular disease

•Nichols. WW et al. Theoretical, Experimental and Clinical Principles. Fifth Edition. 2005:193-213, 339-386
•Safar. ME et al. Handbook of Hypertension: Arterial Stiffness and Wave Reflection. 2005.

Measurement of Central BP

Measurement of Central BP

◆Invasive method

- Fluid Field Catheter
- High Fidelity Catheter Micro-tip Pressure Transducer

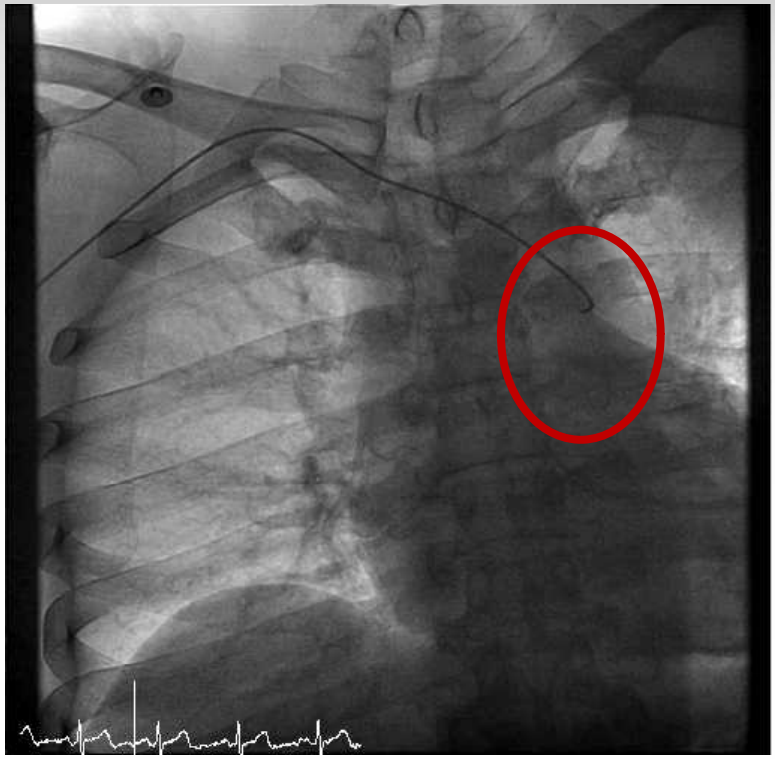
◆Non-invasive methods

- Applanated arterial tonometry
- Echo-Tracking
- Plethysmography

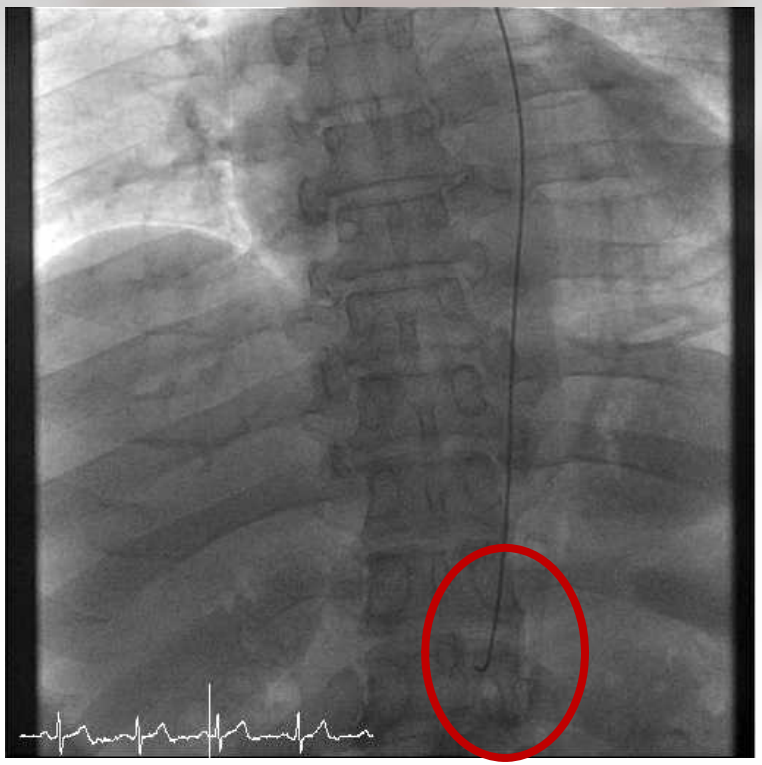
KOREA UNIVERSITY MEDICAL CENTER

Invasive Method

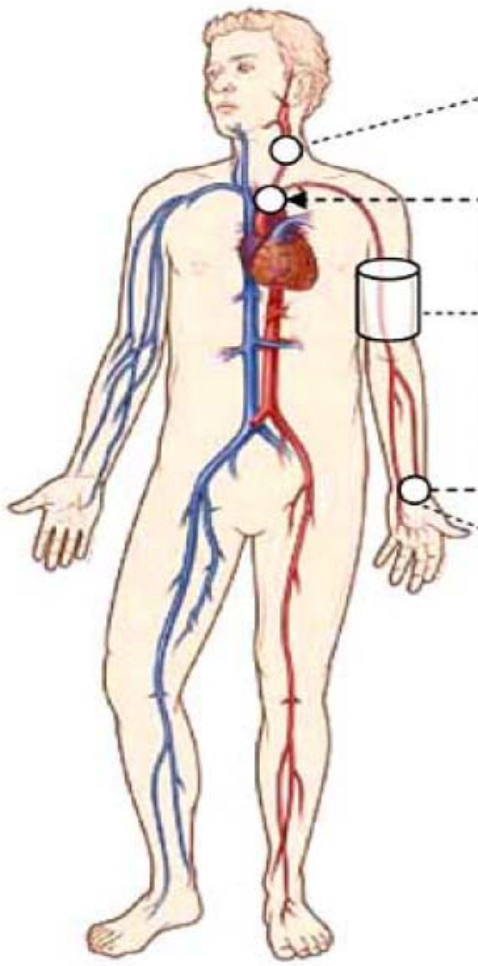
Aortic arch



Abdominal aorta



Non-invasive Method



Recording of carotid BP

Direct estimation of central pressures by applanation tonometry or echo-tracking.

Recording of brachial BP

Statistical derivation of central pressures by using regression equations.

Recording of radial BP

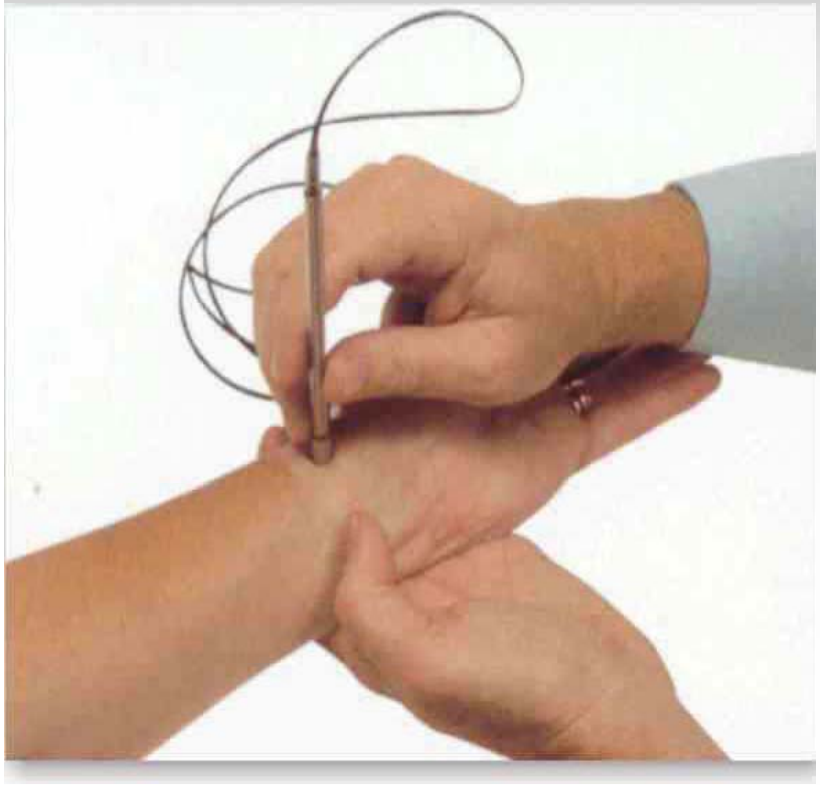
a) Indirect estimation of aortic pressures by applying generalized transfer functions to radial pressure waves.

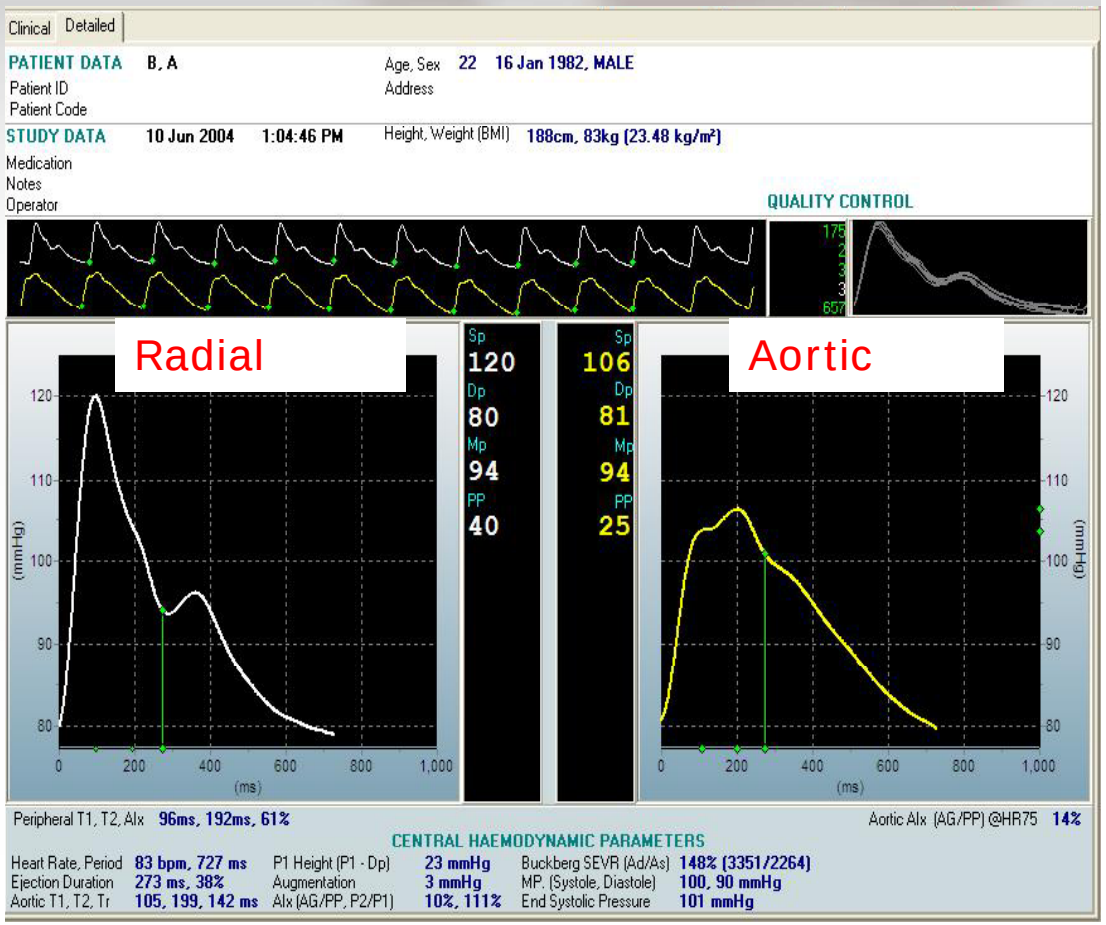
b) Estimation of aortic systolic pressure by detection of 2nd systolic peak of the radial artery.

KOREA UNIVERSITY MEDICAL CENTER

Current Pharmaceutical Design, 2009, 15, 245-253

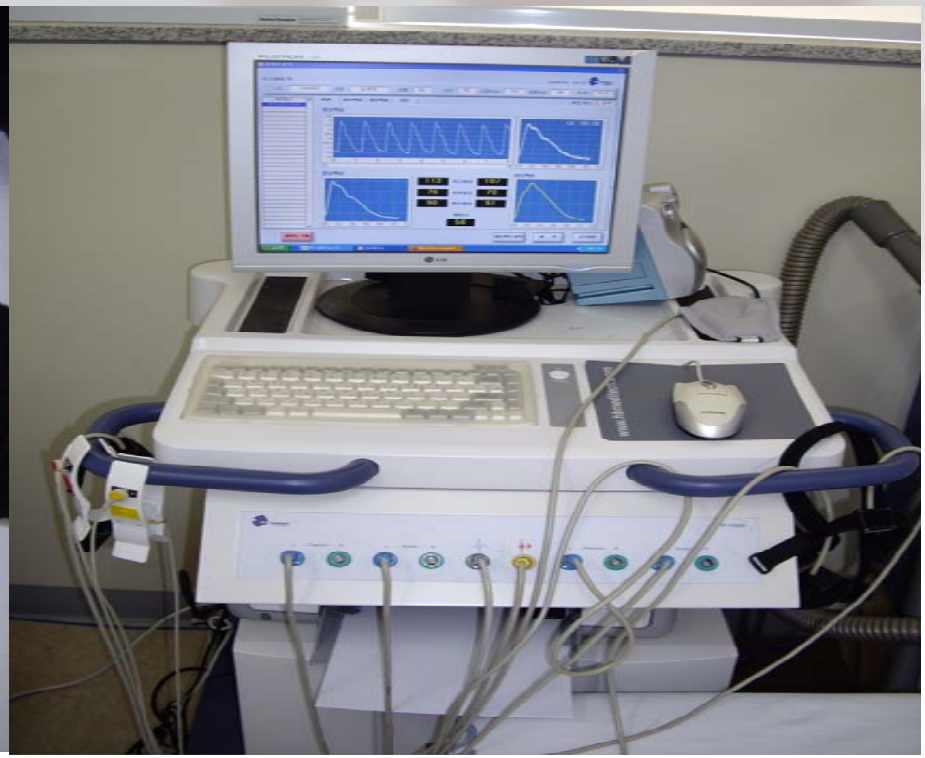
Non-invasive Method (Sphygmocor)





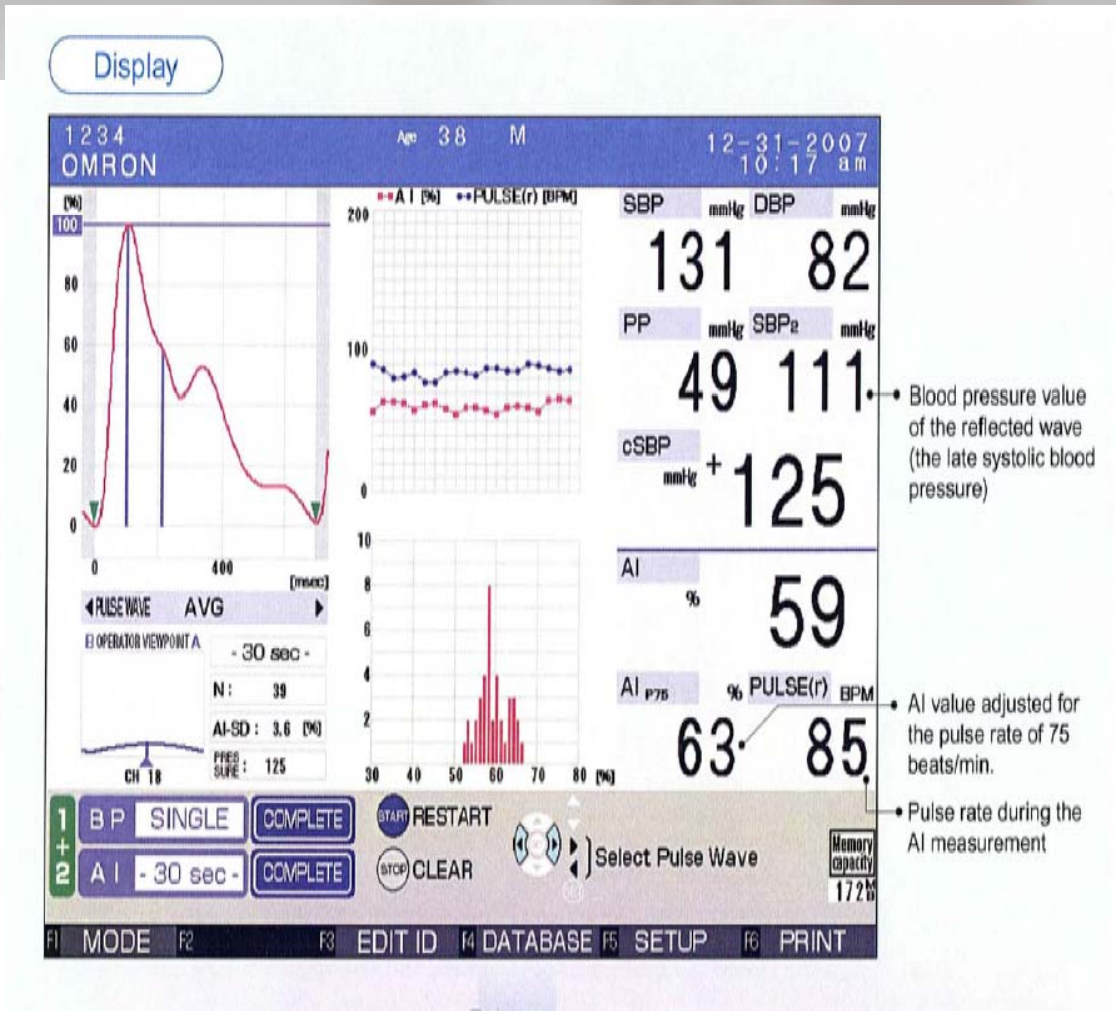
KOREA UNIVERSITY MEDICAL CENTER

Non-invasive Method (GAON, Korea)



Non-invasive Method (HEM-9000AI, Japan)

Desksize suits for ambulatory practice with simple procedure



KOREA UNIVERSITY MEDICAL CENTER

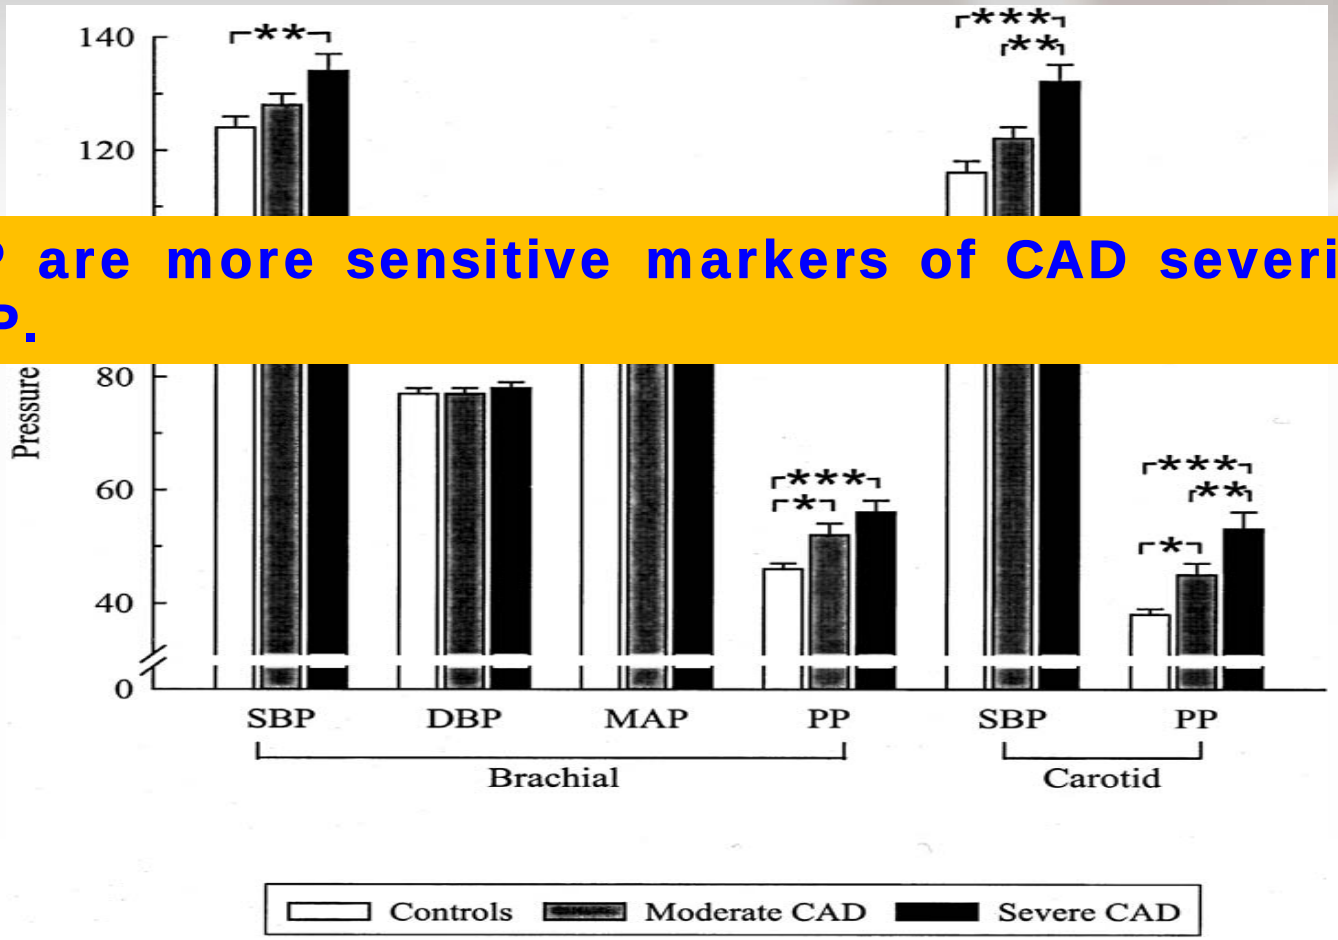
KOREA UNIVERSITY GLOBAL PRIDE

Central Pressure as Marker of Disease

KOREA UNIVERSITY MEDICAL CENTER

Carotid Pressure and CAD Severity

patients with CAD



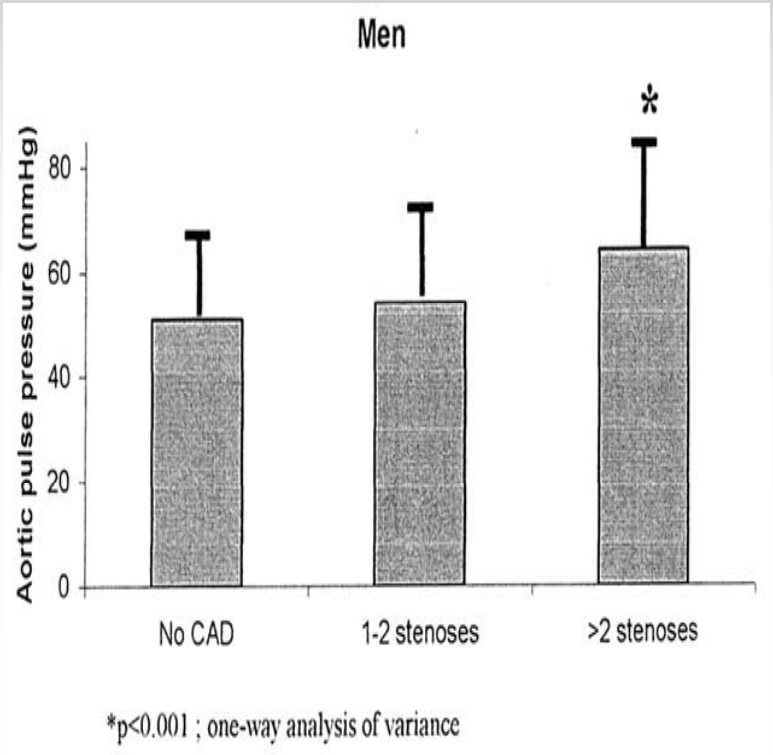
Central BP are more sensitive markers of CAD severity than brachial BP.

KOREA UNIVERSITY MEDICAL CENTER

Waddell, T. K. et al. Hypertension 2001;38:927-931

Aortic PP and Extent of CAD

99 patients with CAD



*p<0.001 ; one-way analysis of variance

Table 3. Multiple logistic regression analysis of prediction of coronary artery disease

Characteristic	Relative Risk	95% CI	*P* Value
Men			
Age	1.04	1.00–1.07	.030
Pulse pressure (for a 1-mm Hg increase)	1.02	1.00–1.04	.043
Hypercholesterolemia	1.84	0.99–3.43	.053
Women			
Age	1.04	1.00–1.09	.046
PVD	9.47	0.94–95.5	.057

PVD = peripheral vascular disease.

aortic PP was significantly correlated with the presence and extent of CAD

Danchin N et al. Am J Hypertens. 2004;17:129-33.

Central Pressure and Vascular Disease (Strong Heart Study)

TABLE 2. Relations of Central and Brachial Blood Pressures and Arterial Stiffness to Carotid Hypertrophy and Extent of Atherosclerosis*

Variable	Intimal-Medial Thickness	Vascular Mass	Plaque Score
P value, brachial PP vs brachial SBP†	<0.001	<0.02	<0.001
P value, central PP vs central SBP†	<0.001	ns	<0.001
P value, central vs brachial SBP†	<0.001	<0.001	<0.001
P value, central vs brachial PP†	<0.002	<0.05	<0.001
P value, arterial stiffness vs brachial SBP†	<0.005	<0.001	<0.001
P value, arterial stiffness vs brachial PP†	ns	ns	<0.02

SBP indicates systolic blood pressure; PP, pulse pressure; ns, not significant.
*All correlations $P<0.001$.
†Correlations compared by Z statistics.

Central BP is more strongly related to vascular hypertrophy and extent of atherosclerosis than is brachial BP

KOREA UNIVERSITY MEDICAL CENTER

Roman MJ et al.Hypertension. 2007;50:197-203.

Central PP and Cardiac Mass

The greater change in LVM on Per/Ind was linked to central and not brachial BP.

Left ventricular mass change (%) — **469 hypertensive patients**

Adjustment (Adj) with	Adj mean (Per/Ind) (95% CI)	Adj mean (atenolol) (95% CI)	Adj mean (Per/Ind – atenolol) (95% CI for difference)
Carotid SBP (Model 1)	−6.6 (−10.2 to −3.0)	−1.4 (−5.7 to +2.8)	−5.17 (−10.88 to +0.53)
Brachial SBP (Model 2)	−6.2 (−9.9 to −2.5)	−2.0 (−6.4 to +2.4)	−4.19 (−10.00 to +1.62)
Carotid PP (Model 3)	−7.2 (−10.8 to −3.6)	−0.7 (−4.9 to +3.6)	**−6.50 (−12.31 to −0.71)**
Brachial PP (Model 4)	−6.3 (−10.0 to −2.6)	−1.8 (−6.2 to +2.6)	−4.53 % (−10.48 to +1.42)

Adjusted (Adj) means [95% confidence interval (CI)] (derived from the general linear model of Table 4) for: left ventricular mass (LVM) change (%) in the Per/Ind (perindopril and indapamide) group; LVM change (%) in the atenolol group; and LVM change (%) in the (Per/Ind – atenolol) groups. Only model 3 (carotid PP) reaches statistical significance. SBP, systolic blood pressure; PP, pulse pressure.

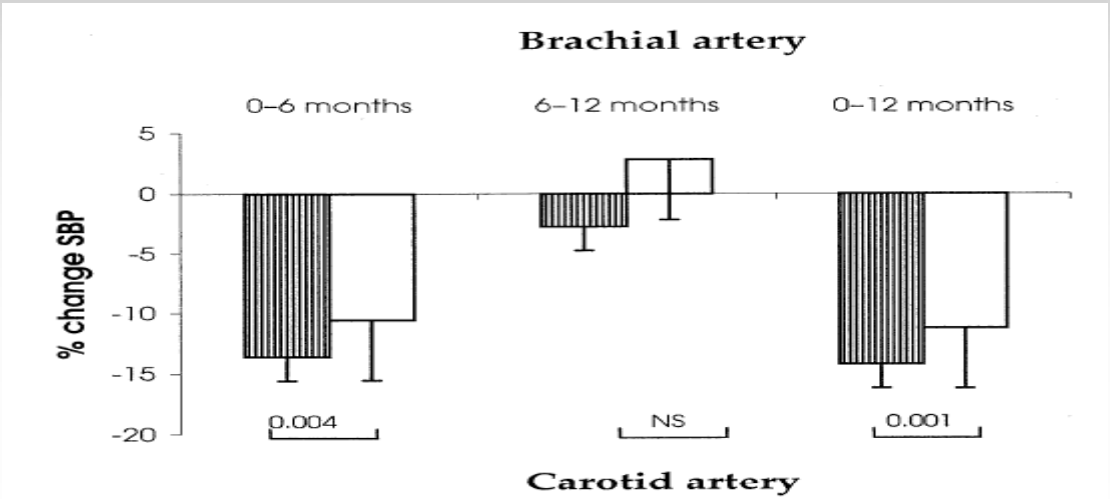
Low-dose Combination of Perindopril/Indapamide in Hypertensive Subjects: Comparison with Atenolol



Perindopril/Indapamide

Atenolol

patients with HTN

Under Per/Ind, but not atenolol, normalization of brachial SBP is achieved with a significantly greater reduction of central SBP

MEDICAL CENTER

REASON trial, London GM et al. J Am Coll Cardiol 2004;43:92-9.

Comparison of the Effects of Antihypertensive Agents on Central BP

Table 2. Hemodynamic Indices Before and After the 10-Week Active Therapy Period 59 pts (>60yrs) with ISH

	Perindopril		Atenolol		Lercanidipine		Bendrofluazide	
Parameter	Placebo	10 wk	Placebo	10 wk	Placebo	10 wk	Placebo	10 wk
Peripheral SBP, mm Hg	153±3	136±4*	156±2	138±4*	146±2	133±3*	154±3	140±3*
Peripheral DBP, mm Hg	80±2	75±2*	84±2	76±3*	80±2	79±3	85±2	82±3
Peripheral PP, mm Hg	72±4	61±4*	72±3	62±3*	66±3	54±4*	69±4	58±4*
Central SBP, mm Hg	140±4	123±4*	144±3	130±4*	132±2	118±3*	139±2	126±2*
Central PP, mm Hg	58±4	46±3*	59±2	53±3	51±3	38±4*	53±4	42±3*

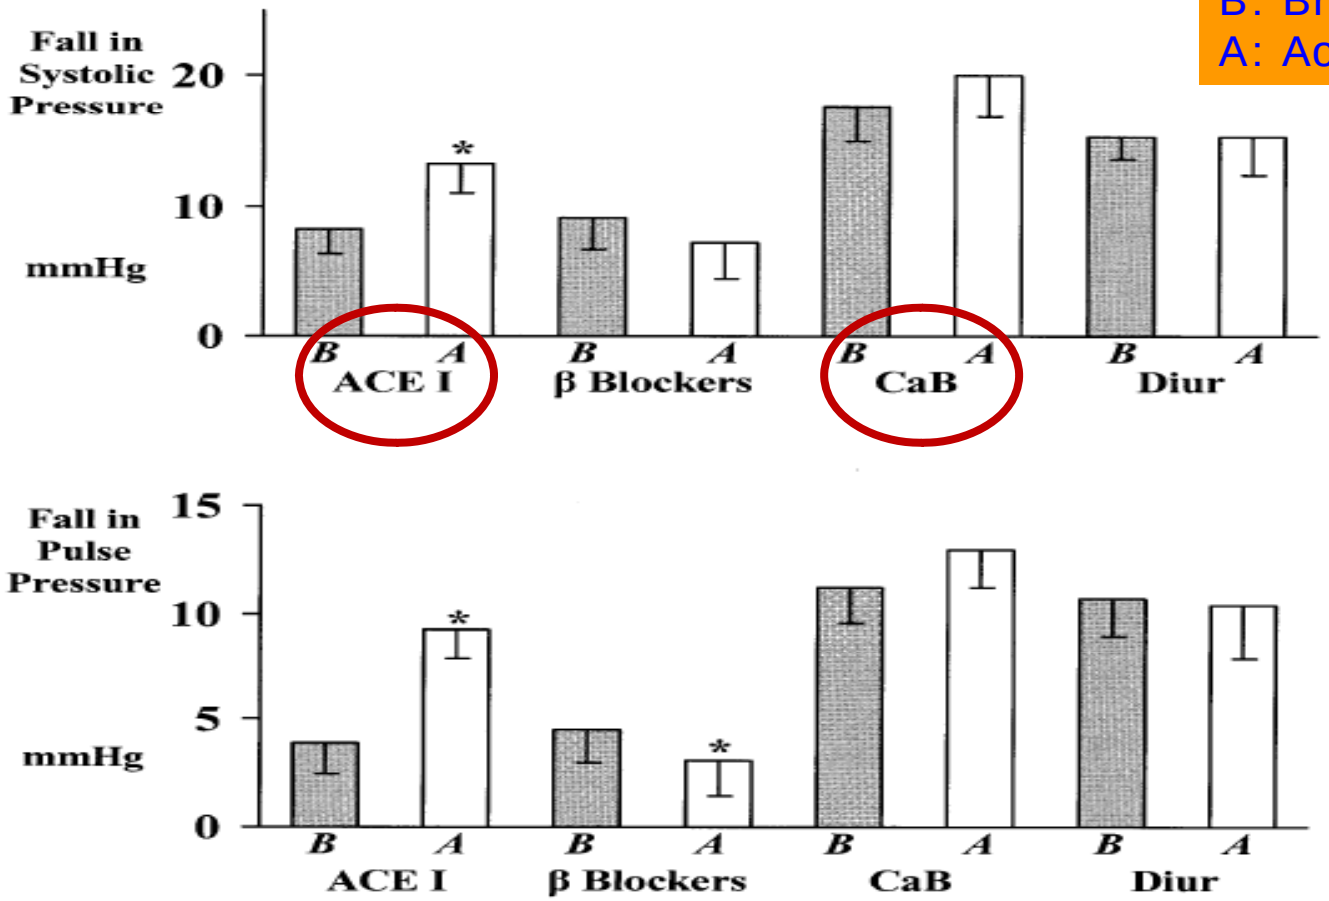
Central PP was only reduced significantly by perindopril, lercanidipine, and bendrofluazide, whereas atenolol had no effect

Hypertension. 2009;54:409-13.

Effect of Different Antihypertensive Drug Classes on Central Aortic Pressure

patients with HTN

B: Brachial artery
A: Aortic root



KOREA UNIVERSITY MEDICAL CENTER

Morgan T et al. Am J Hypertens. 2004;17:118-23.

Effect of Antihypertensive Drug on Central Hemodynamics

Drug class	Aortic PWV	Wave reflection	Carotid stiffness
Diuretics	↔	↔	↓/↔
β-Blockers			
Without vasodilating effect	↓	↑/↔	↔
With vasodilating effect	↓	↓	↓/↔
α-Blockers	↔	↓	NA
Calcium channel blockers			
Dihydropiridines	↓/↔	↓	↓/↔
Non-dihydropiridines	↓	↓	↓
ACE inhibitors	↓	↓	↓
Angiotensin II receptor blockers	↓	↓	↓/↔
Aldosterone antagonists	↓/↔	↓	NA

↑—increased; ↓—reduced; ↔—no change; ACE—angiotensin-converting enzyme; NA—not available; PWV—pulse wave velocity.

KOREA UNIVERSITY MEDICAL CENTER

Current Hypertension Reports 2009;11:190–196

Limitation of Central Pressure

◆Determination of normal values for wave reflections indices and central BPs is mandatory.

◆Extension of the existing data regarding the superiority of central BP over and above brachial BP in a wider range of populations and disease states is desirable

Summary & Conclusion I

◆ Central Pressures

- Differ significantly from peripheral pressures
- More closely related to the pathophysiology of CVD
- Central BP estimation is feasible by simple and reproducible methods
- Subjected to greater changes by drugs than peripheral BP.

KOREA UNIVERSITY MEDICAL CENTER

Summary & Conclusion II

- The assessment of central BP, together with aortic PWV, may give new additional data for the stratification of CV risk in the management of HTN and CVD.

- The prognostic value of central BP in large-scale prospective clinical trials remains a great challenge.

the question follows as to whether central aortic pressures should be measured more routinely in clinical practice

- first, can central aortic pressure be measured in routine clinical practice?
- Second, the only point in measuring central aortic pressures would be if the measurement provided more accurate information than brachial BP about the patients' risk and a better assessment of their response to treatment.

Amplification차이

- Mean BP and diastolic BP change little from the aortic root to brachial artery and represent the tonic component of BP.
- In contrast, systolic BP is the more dynamic, pulsatile pressure component and is amplified with increasing distance from the aortic root. This systolic and pulse pressure amplification process is principally a function of the timing of pressure wave reflections in the circulation.
- These reflections are more likely to augment systolic and pulse pressure as the pressure wave moves from the aortic root and closer to reflecting sites at the periphery [1]. This amplification phenomenon is more pronounced in younger people with healthy conduit arteries who thus have greater brachial systolic and pulse pressures relative to their corresponding central aortic pressures.
- Aortic:brachial pulse pressure amplification can be quite marked in young healthy people, and atypical brachial:aortic ratio is 1.5.
- The amplification process diminishes with ageing, principally due to aortic stiffening and an increased pulse wave velocity. Thus, with ageing or aortic stiffening or both, central aortic pressures are closer to the brachial pressures but are rarely the same

Aortic PP was a Significant Risk Factor for the Extent of CAD

Table 4. Multiple regression analysis of the number of diseased coronary vessels

Factor	Regression Coefficient	R^2	*P*
Gender (0 male, 1 female)	−0.55	0.022	.013
Aortic pulse pressure (mm Hg)	0.0125	0.10	.023
Dyslipidemia (1 yes/0 no)	0.286	0.059	—
Age (y)	−0.011	0.028	—
Diabetes mellitus (1 yes/0 no)	0.249	0.024	—
Aortic mean BP (mm Hg)	0.005	0.005	—
Current smoker (1 yes/0 no)	0.09	0.0006	—

Dependent variable: number of diseased vessels ($r^2 = 0.24$; $P < .001$). Abbreviation as in Table 3.

Implications for Cuff (Brachial) BP

- Inaccurate indicator of hypertension ?
- Poor indicator of central systolic BP, cardiac load, and LVH ?
- Poor indicator of renal and cerebral microcirculatory pulsatile loads and organ damage ?
- Poor indicator of beneficial effects of antihypertensive drugs ?

Table 1 Central aortic pressures and major clinical outcomes in recent clinical studies

Patient group	Follow-up (months)	Outcome	Number of events	Dominant BP variable in multivariate analysis	Hazard ratio per 10 mmHg[a] or SD (95% CI)
End-stage renal disease	52	All cause mortality	70	Central pulse pressure (C)	1.4 (1.1–1.8)
Male coronary heart disease patients	39	All cause mortality	64	Central pulse pressure (D)	1.18[a] (1.05–1.33)
Treated hypertensive patients	36	Composite of CV and renal events	305	Central pulse pressure (R)	1.11[a] (1.0–1.21)
Unselected cohort of American Indians	58	Fatal and nonfatal CV events	319	Central pulse pressure (R)	1.15[a] (1.07–1.24)
Unselected elderly population	96	CV mortality	45	Central systolic pressure (C)	1.33[a] (1.03–1.72)
Coronary heart disease patients	54	Fatal and nonfatal CV events	246	Central pulse pressure (D)	1.25 (1.09–1.43)
Unselected Chinese community	120	CV mortality	130	Central systolic pressure (C)	1.30[a] (1.12–1.52)

Estimation of central systolic blood pressure using an oscillometric blood pressure monitor

Hao-Min Cheng[1,2], Kang-Ling Wang[2,3], Ying-Hwa Chen[2,3], Shing-Jong Lin[1,4], Lung-Ching Chen[2,3], Shih-Hsien Sung[2,3], Philip Yu-An Ding[2,3], Wen-Chung Yu[2,3], Jaw-Wen Chen[1,4] and Chen-Huan Chen[1,2,4]

Current noninvasive techniques for assessing central aortic pressure require the recording of an arterial pressure wave using a high-fidelity applanation tonometer. We therefore developed and validated a novel method to estimate the central aortic systolic pressure using an oscillometric blood pressure monitor alone. Invasive high-fidelity right brachial and central aortic pressure waves, and left-brachial pulse volume plethysmography from an oscillometric blood pressure monitor, were obtained at baseline and 3 min after administration of sublingual nitroglycerin in 100 patients during cardiac catheterization. In the initial 50 patients (Generation Group), Central systolic blood pressure was predicted by a multi-variate prediction model generated from the comprehensive analysis of the invasive brachial pressure wave, including brachial late-systolic shoulder pressure value and parameters related to wave reflection and arterial compliance. Another prediction model was similarly constructed from the noninvasively calibrated pulse volume plethysmography. Both models were validated in the subsequent 50 patients (Validation Group) with results: r=0.98 (P<0.001) and mean difference=0.5 ± 4.5 (95% confidence interval −8.3 to 9.3) mm Hg for the invasive model, and r=0.93 (P<0.001) and mean difference=−0.1 ± 7.6 (95% confidence interval −15.0 to 14.8) mm Hg for the noninvasive model. Thus, our results indicate that central aortic systolic blood pressure could be estimated by analysis of the noninvasive brachial pressure wave alone from an oscillometric blood pressure monitor.
