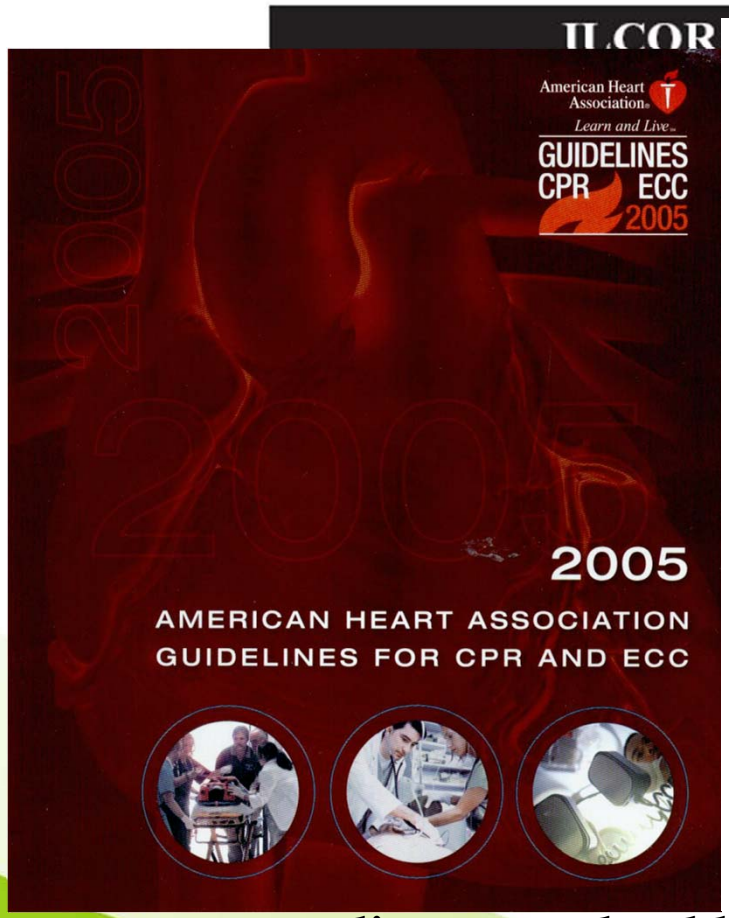
International Recommendation

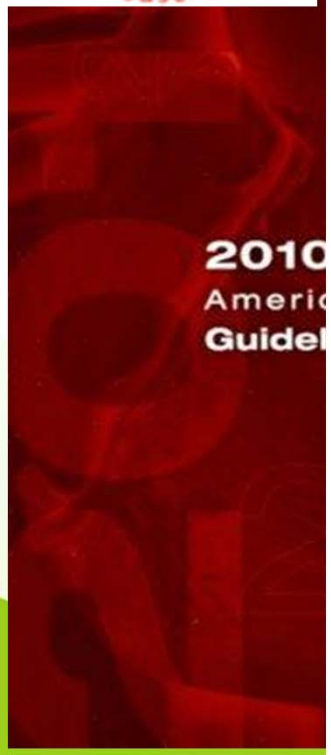


- Unconscious adult patients with ROSC after OHCA should be cooled to 32°C to 34°C for 12 to 24 hours when the initial rhythm was VF **(Class IIa)**
- With non-VF arrest out of hospital or for in-hospital arrest **(Class IIb)**

cardiac arrest should be cooled to 32-34°C for 12-24 hrs

- **Possible benefit for other rhythms or in-hospital cardiac arrest**

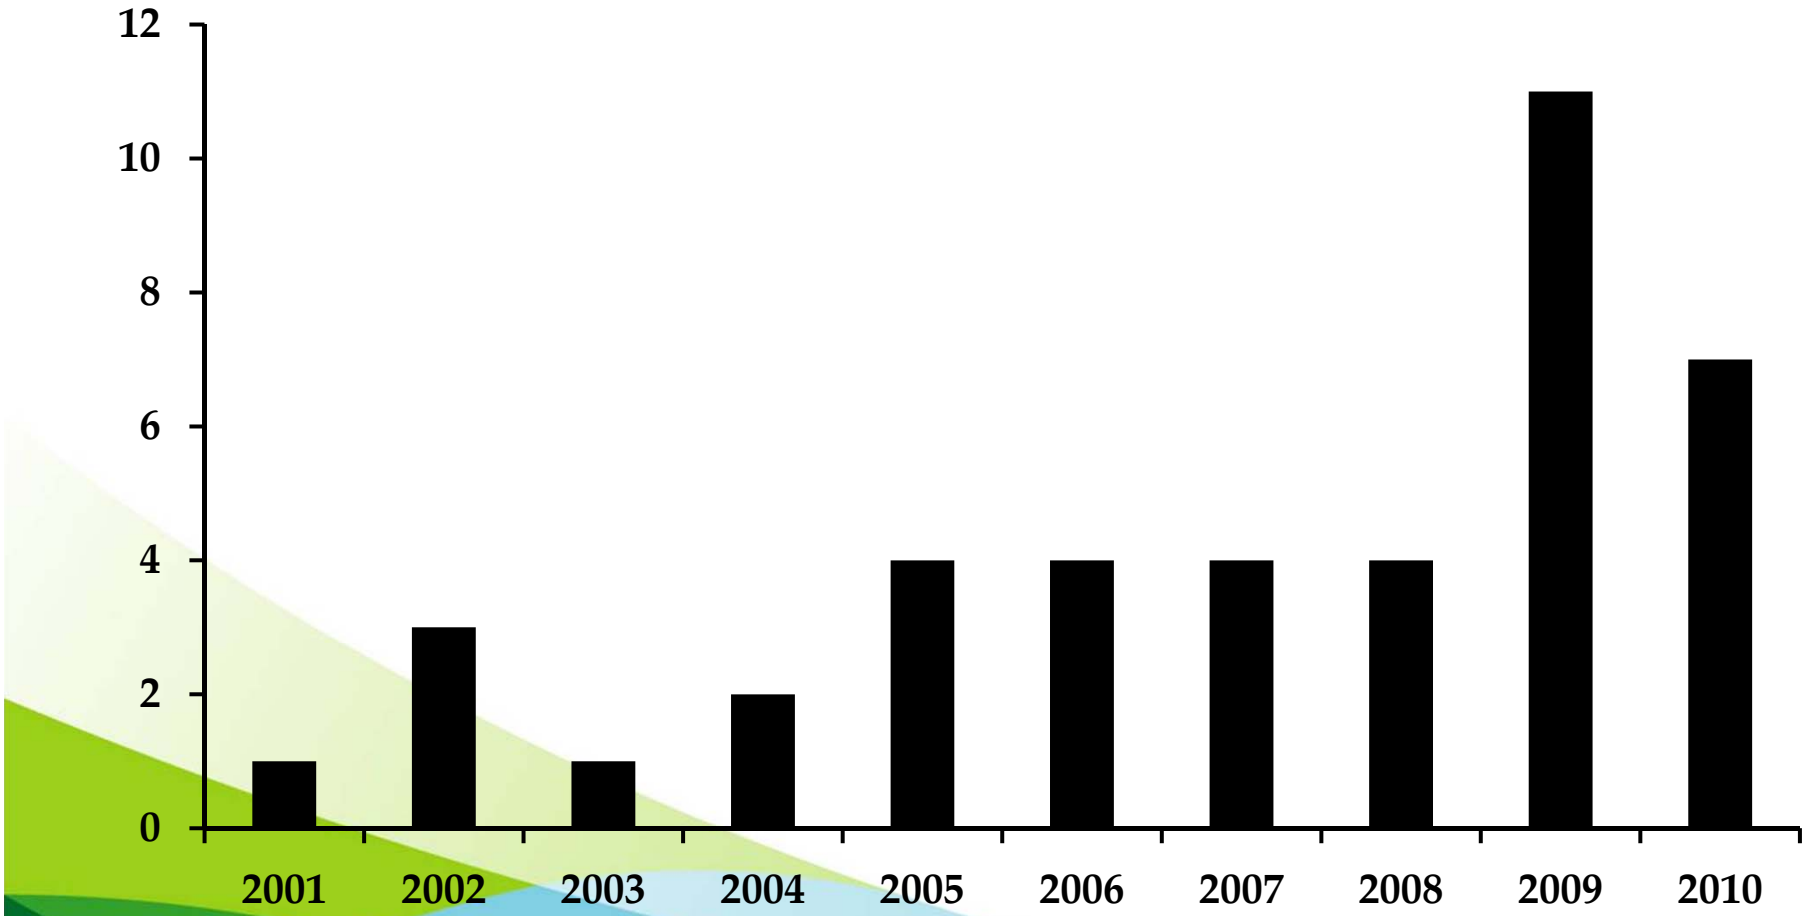
Current Recommendation



Treatment Recommendation

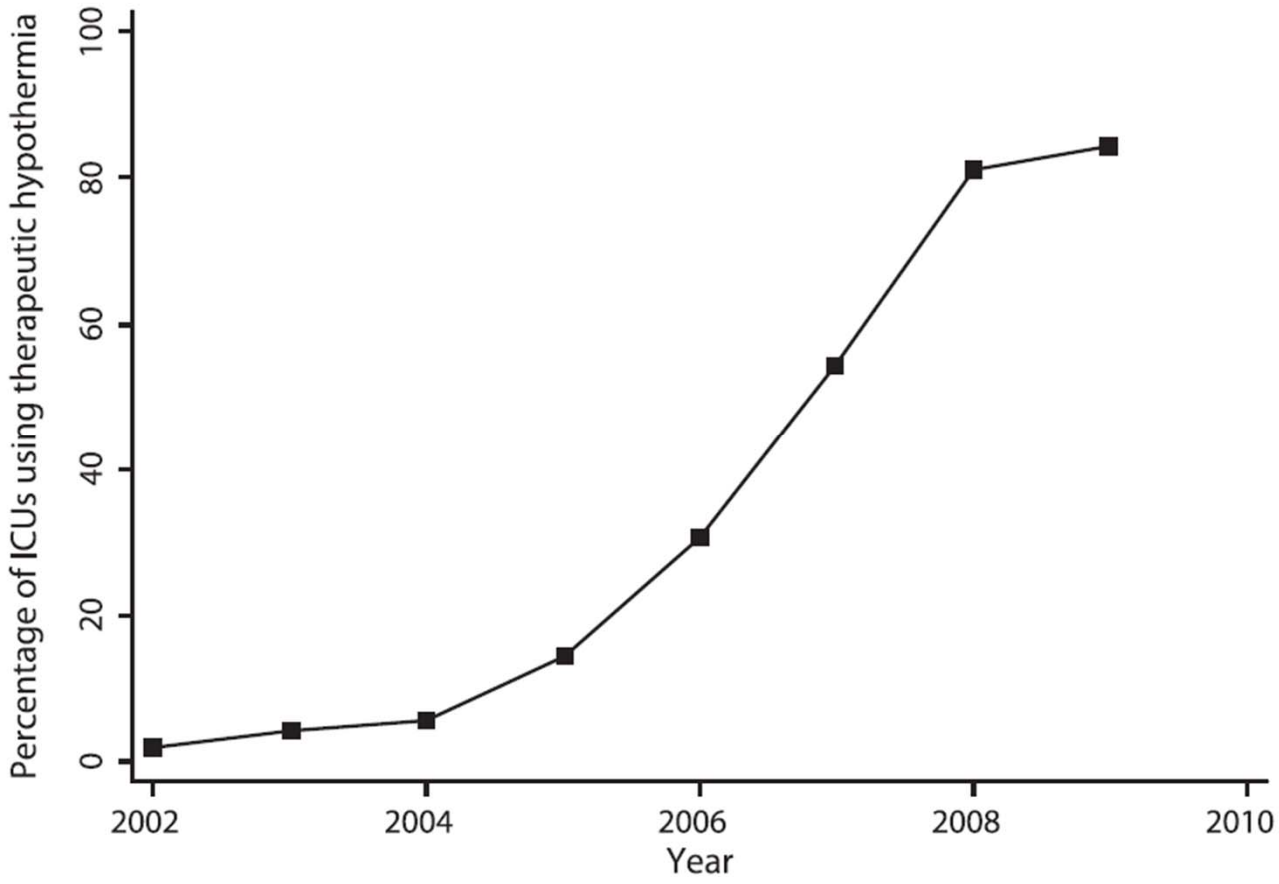
Comatose adult patients (not responding in a meaningful way to verbal commands) with spontaneous circulation after out-of-hospital VF cardiac arrest should be cooled to 32 to 34°C for 12 to 24 hours. Induced hypothermia might also benefit comatose adult patients with spontaneous circulation after out-of-hospital cardiac arrest from a nonshockable rhythm, or cardiac arrest in hospital. Rapid infusion of ice-cold IV fluid 30 mL/kg or ice packs are feasible, safe, and simple methods for initially lowering core temperature up to 1.5oC. When IV fluids are used to induce hypothermia, additional cooling strategies will be required to maintain hypothermia. Limited available evidence suggests that PCI during therapeutic hypothermia is feasible and safe and may be associated with improved outcome.

Yearly Increase in RCT for TH (Published OR Ongoing)



Yearly Increase in Implementation of TH

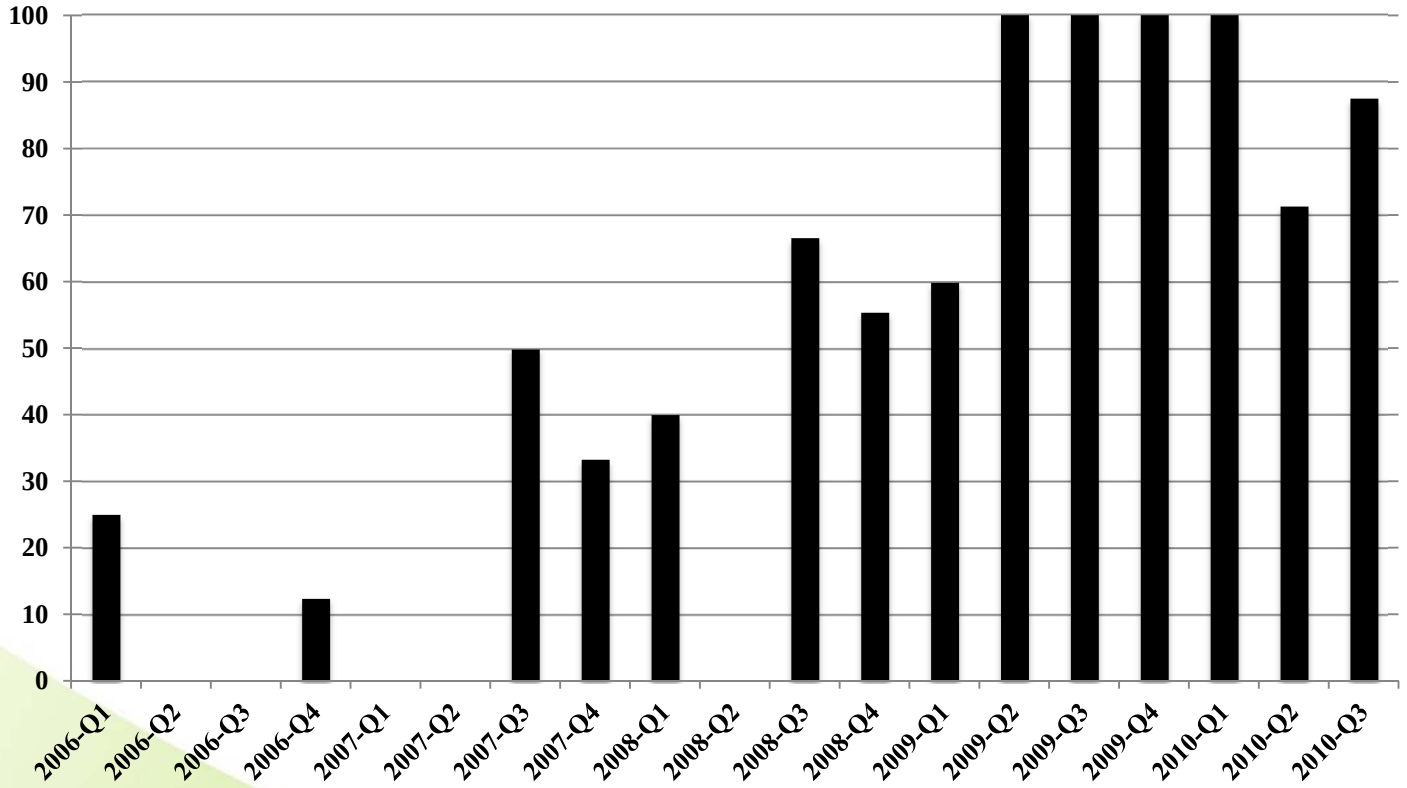
A Telephone Survey(response rate, 98.4%) , 243 UK ICUs



Binks AC, et al. *Anaesthesia* 2010;65: 260-5

Yearly Increase in Implementation of TH

Seoul St. Mary's Hospital, 2006.1.1-2010.7.31, OHCA



Youn CS, et al. Presented at *2010 KSEM Fall Meeting*

Practical Questions When Applying TH

- Who to cool?
- When to start cooling?
- How deep to cool?
- How long to keep cool?
- How to cool?
- What physiological changes and side effects can be developed?
- What adjunctive drugs should be given?
- Where to measure temperature?

Who to cool?

Shockable Rhythms

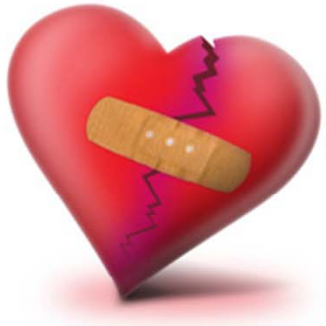
THAPCA Trials

Cardiopulmonary arrest (when the heart stops beating) is a tragic event in children that is associated with high rates of death and long term disability.



The Need

In children, this can occur in the hospital as a complication of many different medical conditions; cardiac arrest can also occur, suddenly, outside of the hospital as a result of an accident such as near drowning or a sudden illness. There is a great need for better treatments for children resuscitated after cardiac arrest in each setting to improve ultimate quality of life and to prevent long term brain injury or death.

The National Heart, Lung, and Blood Institute (NHLBI) is funding the first large scale, multi-center study to help determine the best treatment for children who are successfully resuscitated after a cardiac arrest.

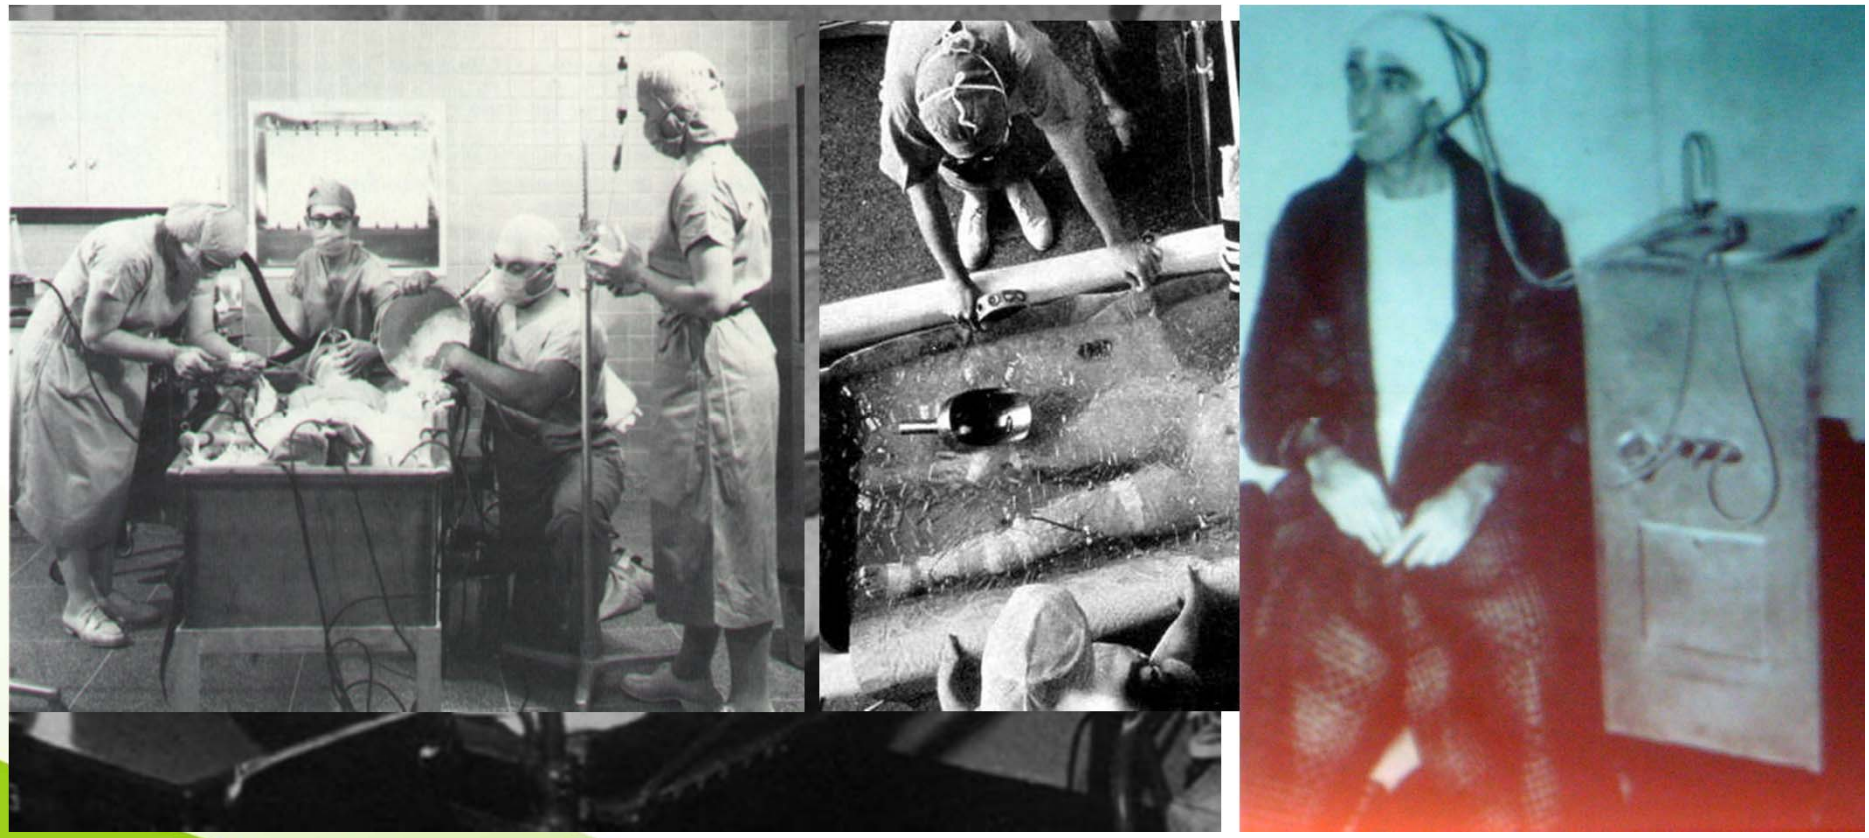
How to cool?

Ideal Cooling Methods and Devices

- Fast
- Easy
- Non-invasive
- Non-messy
- Cheap
- Controllable
- Short and longer term use

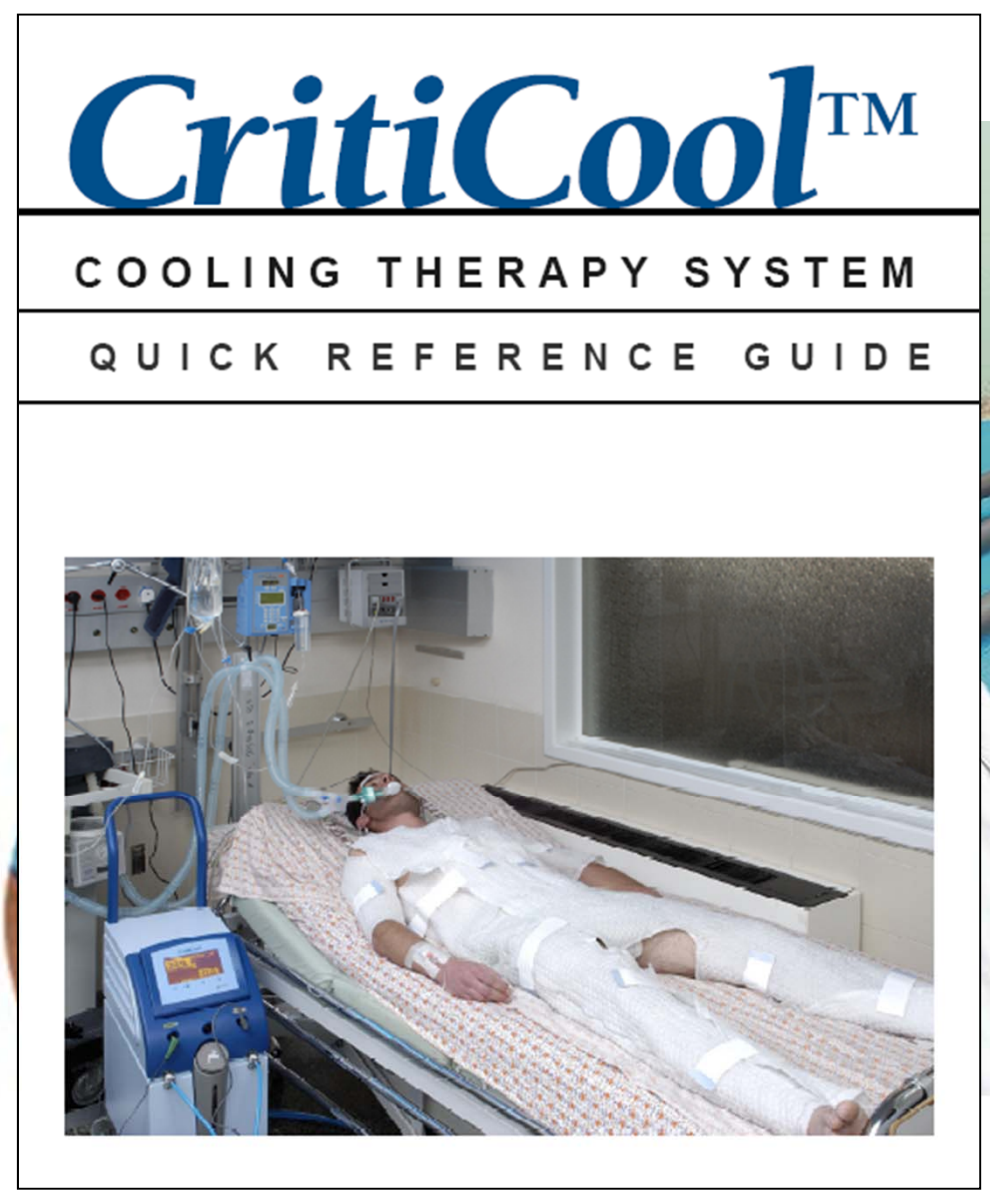
Cooling Methods and Devices



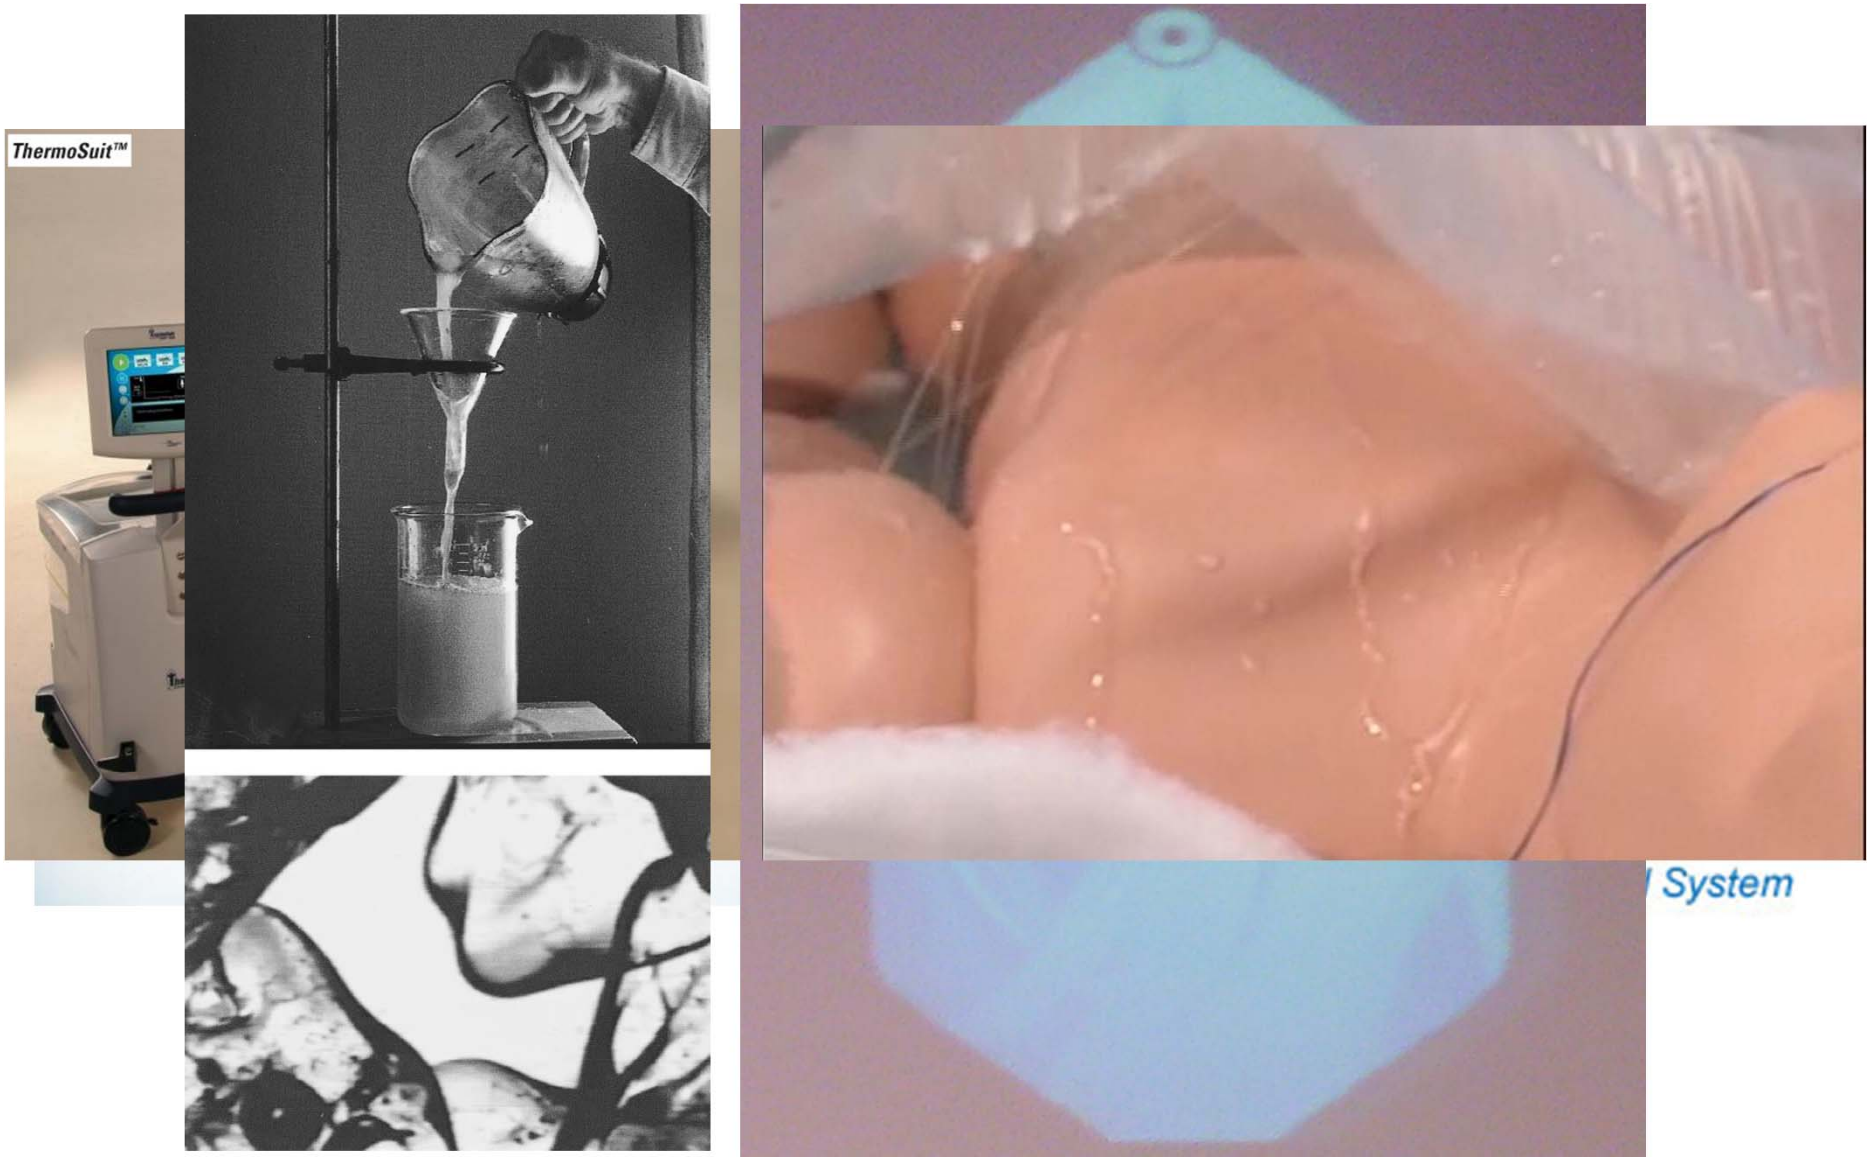
How to cool?

Cooling Methods and Devices

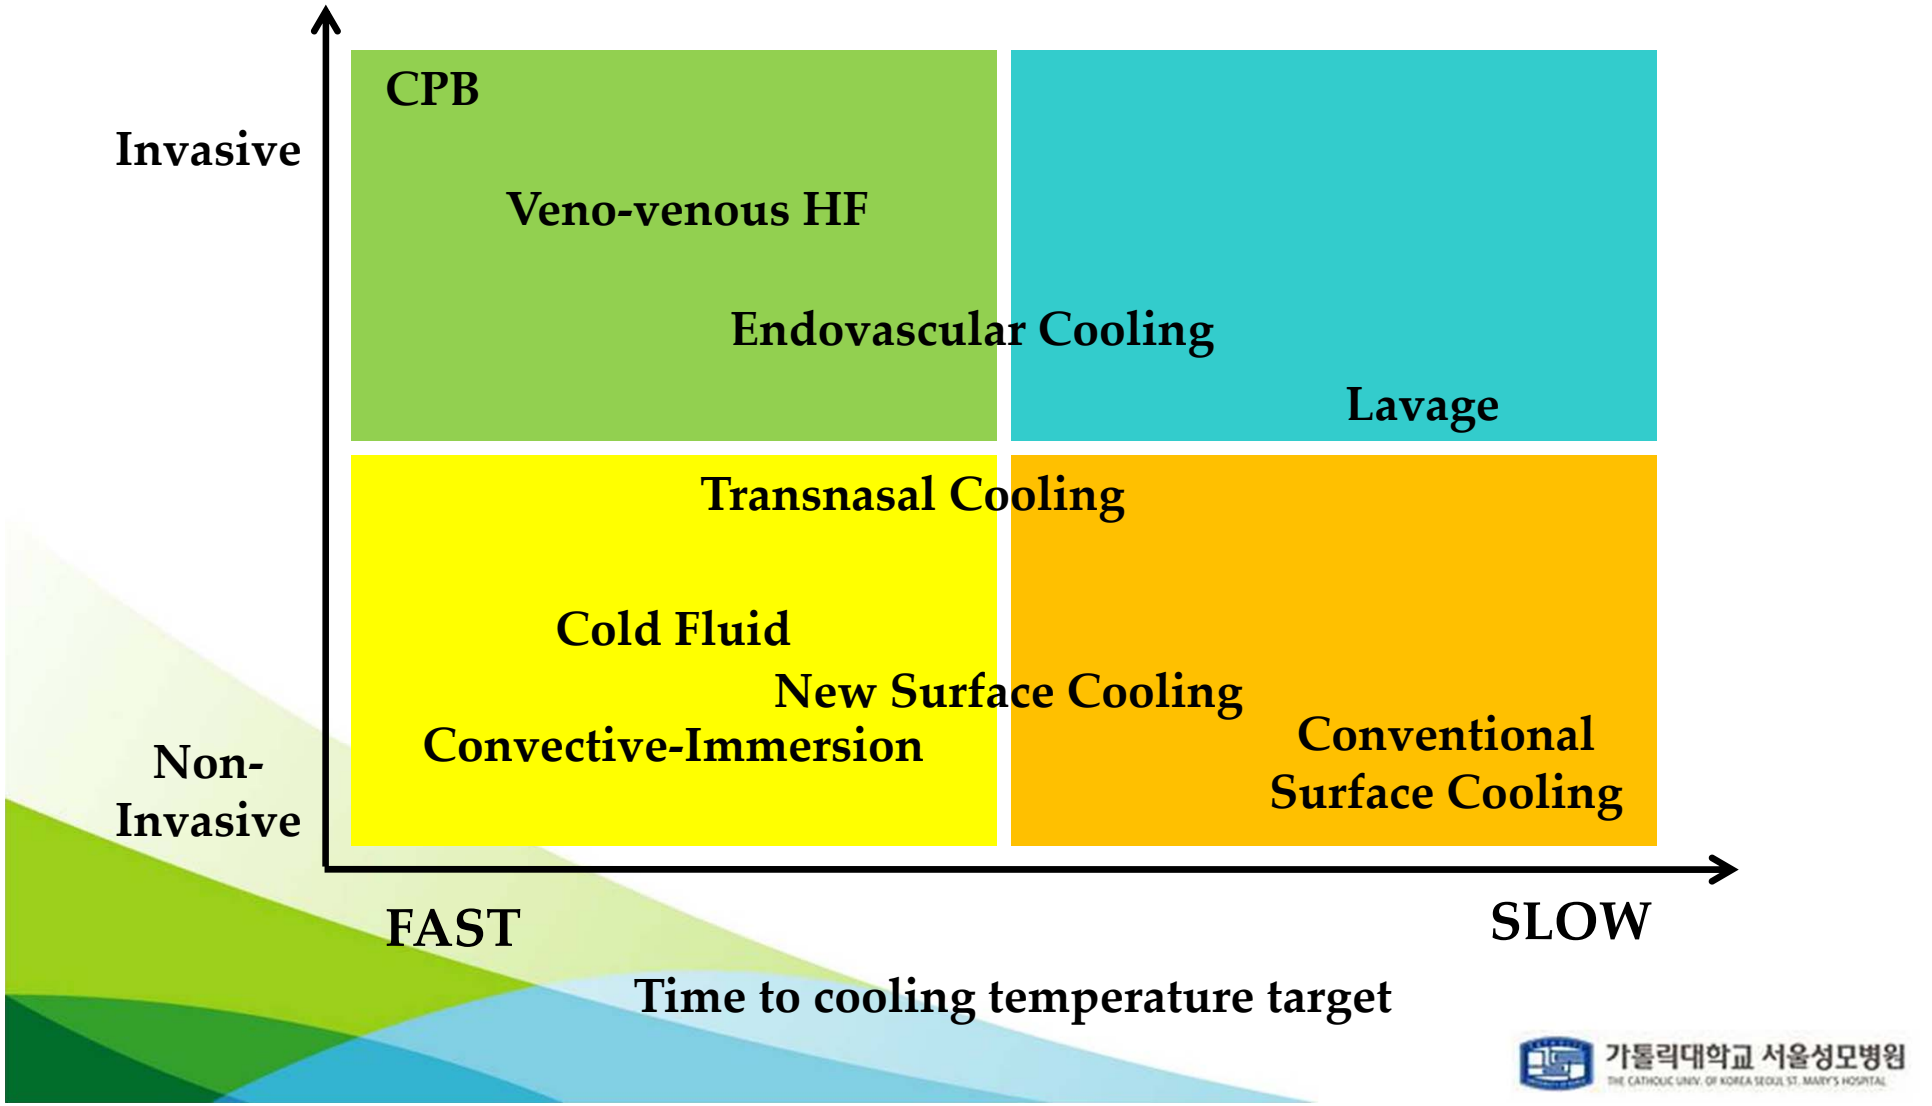
New Methods and Devices



New Methods and Devices



Efficacy and Safety of Cooling Methods



Comparison of Cooling Rate

Techniques or Methods	Rate(°C/hr)
Cold air (TheraKool®)	0.18
Ice packs (head)	0.32
Helmet with chemical cooling capabilities (Frigicap®)	0.5
Water-circulating external cooling garment (CritiCool®)	0.7
Ice packs (whole body)	0.9
Hydrogel energy transfer pads (Arctic Sun®)	1.04
Endovascular catheter (Cool Guard®)	1.46
Transnasal coolant spray (BeneChill®)	1.6
Specialized new cooling helmet	1.84
Water immersion cooling system (Thermosuit®)	3.0
Hypocarbon-filled cooling pads (EMCOOLSpad®)	3.0
Cold fluid infusion (cardiac arrest, 60ml/kg/hr)	3.4
Thermosuit® with propofol sedation	4.2
Cold fluid infusion (volunteers, 80ml/kg/hr)	5.0
Ice water immersion	6.6

Endovascular vs. External Cooling

Multicenter RCT, Endovascular vs. External cooling after cardiac arrest, 400 OHCA, France

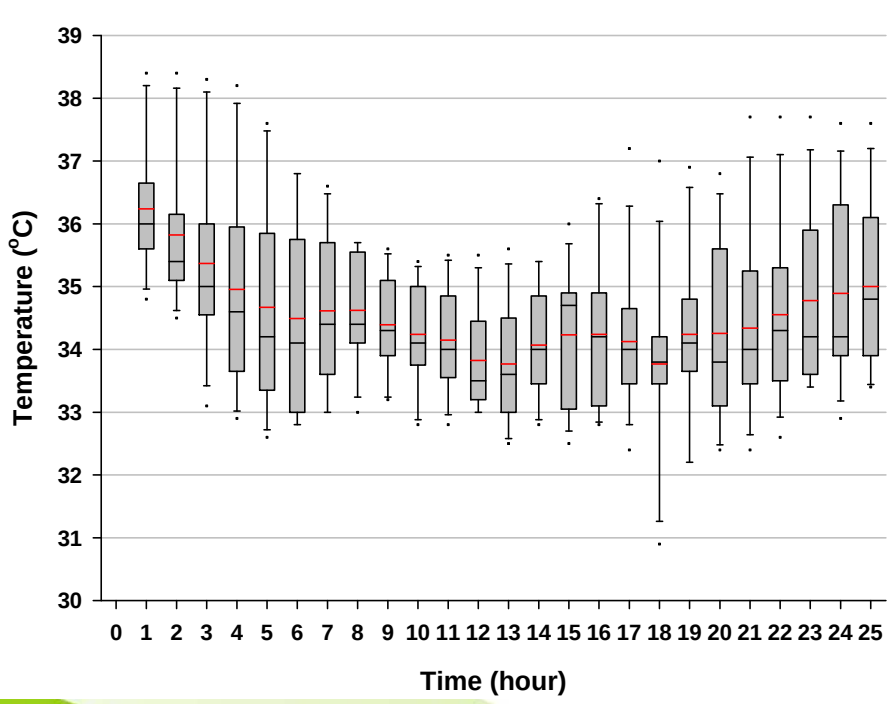
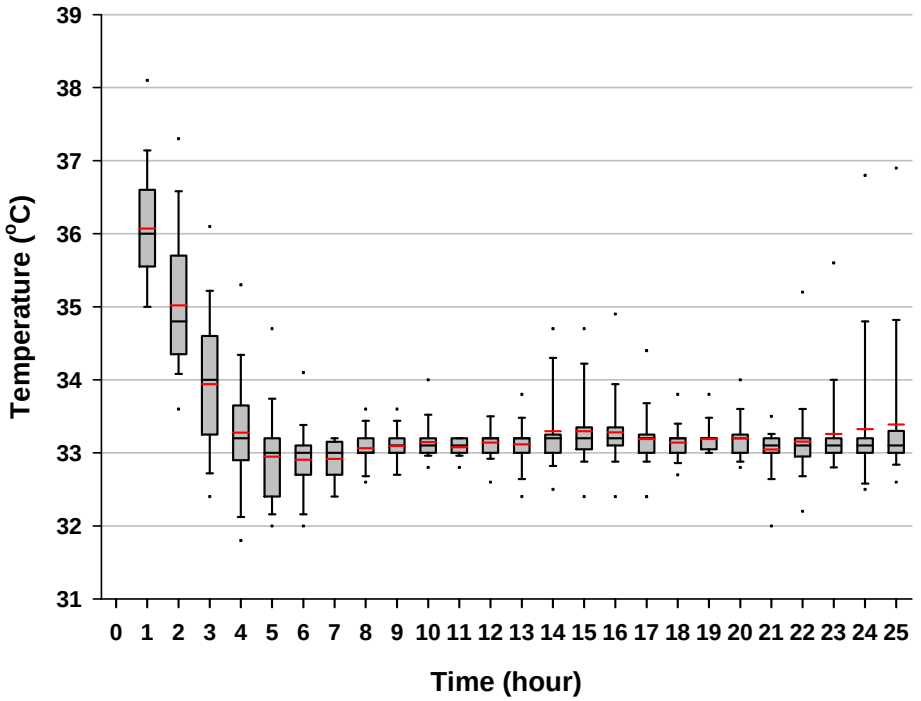
Endovascular Cooling (Cool line™ catheter)

Ice-Water Soaked Towels with Fanning

Surface only vs. Combination II





Kim YM, et al. Presented at *2010 KSEM Fall Meeting*

What physiological changes and side effects can be developed during TH?

What adjunctive drugs should be given?

Physiological changes?

Physiologic Effects of TH

Body System	Physiologic Effect	Nursing Actions
Systemic	Decreased metabolic demands	
	Decreased CO_2 production	
	Decreased O_2 consumption	Monitor pulse oximetry and P_aO_2
Neurologic	Decreased cerebral metabolic demands	
	Decreased intracranial pressure	
	Decreased level of consciousness	
Cardiovascular	Tachycardia (observed during induction)	
	Bradycardia	None, unless symptomatic
	Hypertension	Wean vasopressors, administer analgesics and sedation if appropriate
	Hypotension	Consider fluid administration and vasopressors
	Prolonged PR, QRS, and QT intervals	
	Dysrhythmias (observed ≤32°C)	Prevent overcooling
	Decreased cardiac output	None, unless hypotensive or symptomatic
	Increased central venous pressure	
	Increased mixed venous oxygenation values	
Gastrointestinal	Decreased motility	Feeding may be delayed until the rewarming phase
Genitourinary	Diuresis	Monitor urine output; replace fluids as needed
Endocrine	Insulin resistance	Administer insulin to maintain glucose within a prescribed range
Immune	Suppression of white blood cells	Institute ventilator-associated pneumonia bundles, elevated head of bed, take measures to prevent infection

Kupchik NL. *Crit Care Med* 2009;37(Suppl): S279-84

Physiologic Effects of TH

Pharmacokinetics ≤35°C

Altered clearance of various medications (data available for muscle paralyzers, propofol, fentanyl, phenytoin, pentobarbital, verapamil, propanol and volatile anesthetics (reduced clearance), but in all likelihood applies to many other types of medication)

No effect on gentamycin clearance in animal experiment

No effect on neostigmine effect or clearance in healthy volunteers

Polderman KH. ***Intensive Care Med*** **2004;30: 757-69**

Changes in Laboratory Findings

Frequency	Effect
Almost always	Mild to moderate increase in serum amylase levels (300–600 μ/l) Mild thrombocytopenia (platelet count 100–150x10^{12}) Increase in serum lactate levels (2.5–5 mmol/l)
Frequent	Moderate to severe thrombocytopenia (platelet count 30–100x10^{12}) Rise in serum glucose levels (due to decreased insulin sensitivity and decreased insulin secretion) High serum amylase levels (600–1200 μ/l) High serum lactate levels (5–7 mmol/l) Decrease in levels of potassium (K), magnesium (Mg), phosphate (P), calcium (Ca) Leukocytopenia (WBC (2–3x10^{9}/l)
Occurring regularly	Mild increase in liver enzymes (particularly SGOT and SGPT) Metabolic acidosis (due to increase in lactate levels and increased production of free fatty acids, ketones and glycerol) Slightly increased APTT and APTT
Occurring occasionally	Manifest acidosis, lactate levels ≥7 mmol/l Severe leukocytopenia (WBC <2x10^{9}) Increase in serum amylase ≥1200 μ/l Severe thrombocytopenia (platelet count ≤30x10^{12}) Manifest coagulation disorders with marked increase in APTT and PTT

Polderman KH. ***Intensive Care Med*** **2004;30: 757-69**

Immediate Side Effects in the Induction Phase

- Hypovolemia
- Electrolytes (K, Mg, P) disorders
- Hyperglycemia

Polderman KH. *Crit Care Med* 2009;37(Suppl): S186202

Adverse Events

Adverse Event	Targeted Temperature Management (N = 300)	Standard Treatment (N = 285)
	no. (%)

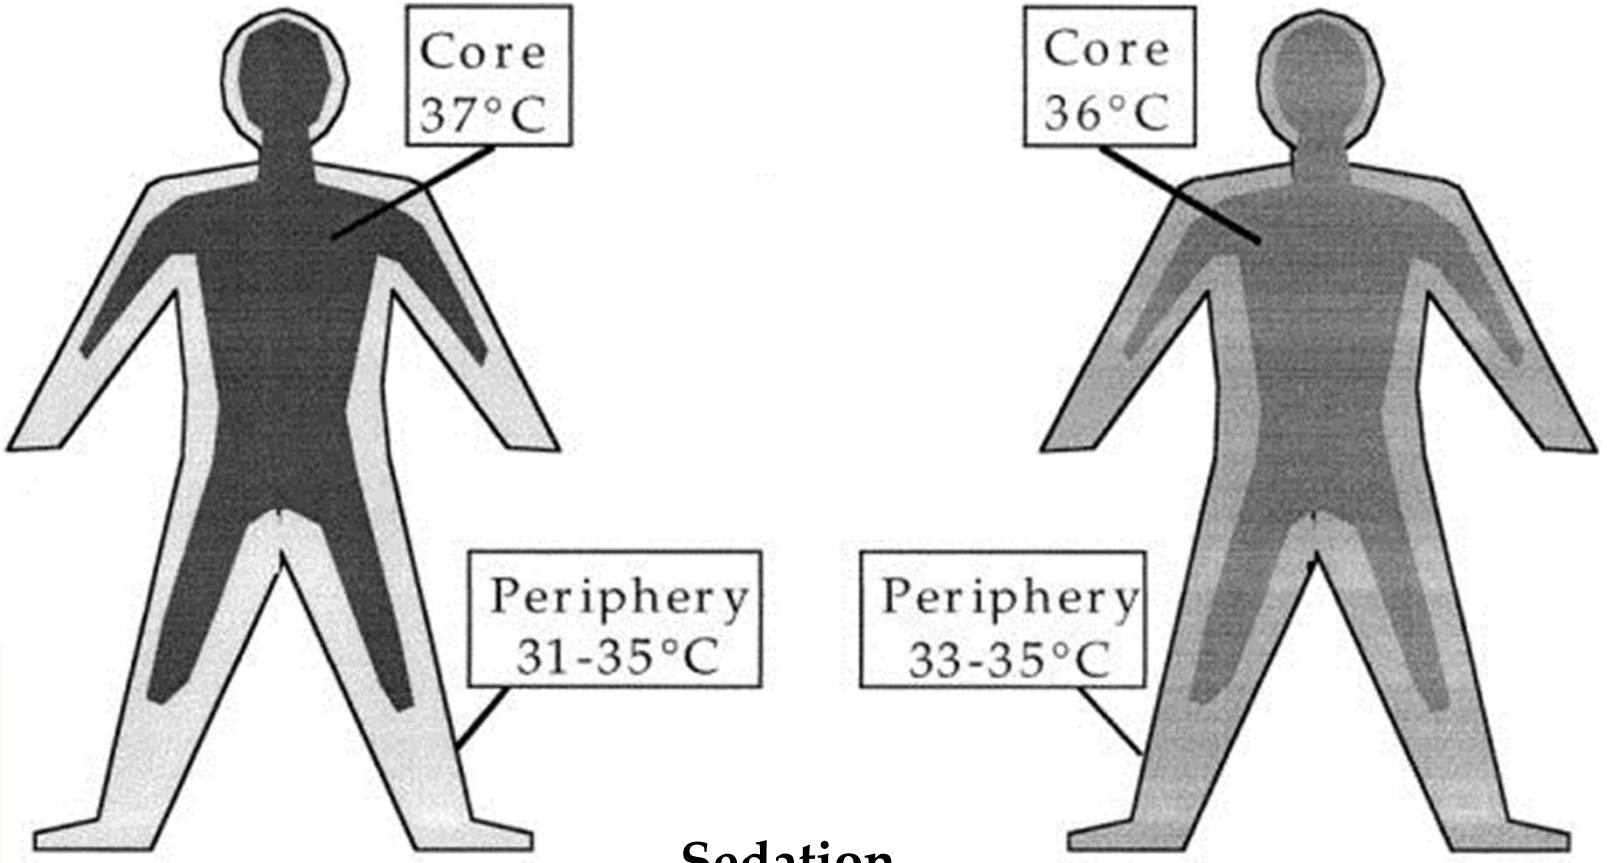
Sedation and/or Paralysis



Commonly Used Drugs

Drug	Efficacy	Hypotensive Effect	Sedative Effect	Advantage	Disadvantage
Midazolam	**++**	**+**	**++++**	Less hypotensive	Reduced metabolism
Propofol	**+++**	**+++**	**++++**	Brief-acting, Anti-seizure effect	More pronounced hypotension
Fentanyl	**+++**	**+**	**++**	Rapid-acting, Mild hypotensive	Reduced metabolism
Meperidine	**++++**	**+++**	**++**	Rapid-acting, Mild hypotensive	Slower metabolism
NM blockers	**+++++**	**-**	**-**	Most effective	No effect at the central level Mask insufficient sedation and/or seizure activity Risks of polyneuromyopathy

Polderman KH & Herold I. ***Crit Care Med*** **2009;37:1101-20**

Adjunctive drugs?

Remifentanil + Propofol vs. Fentanyl + Midazolam

ClinicalTrials.gov

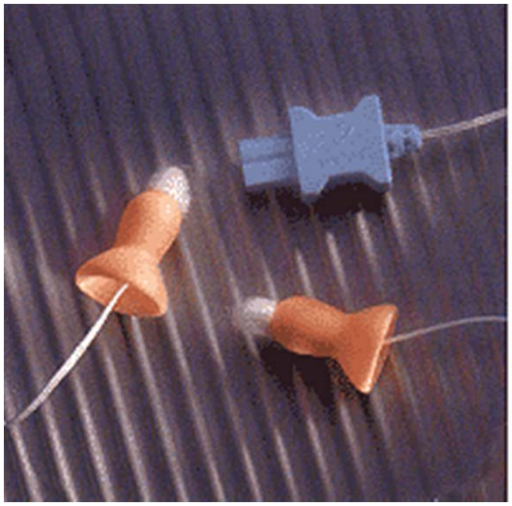
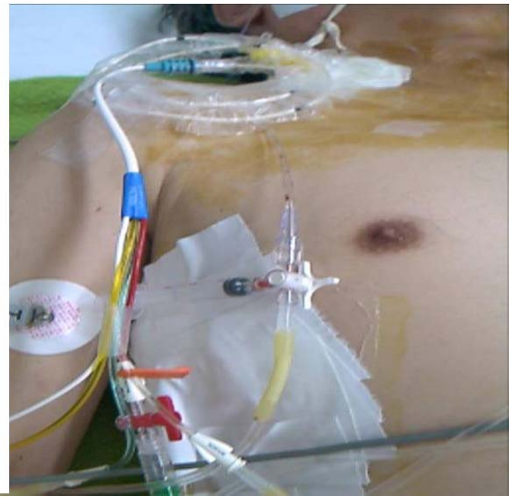
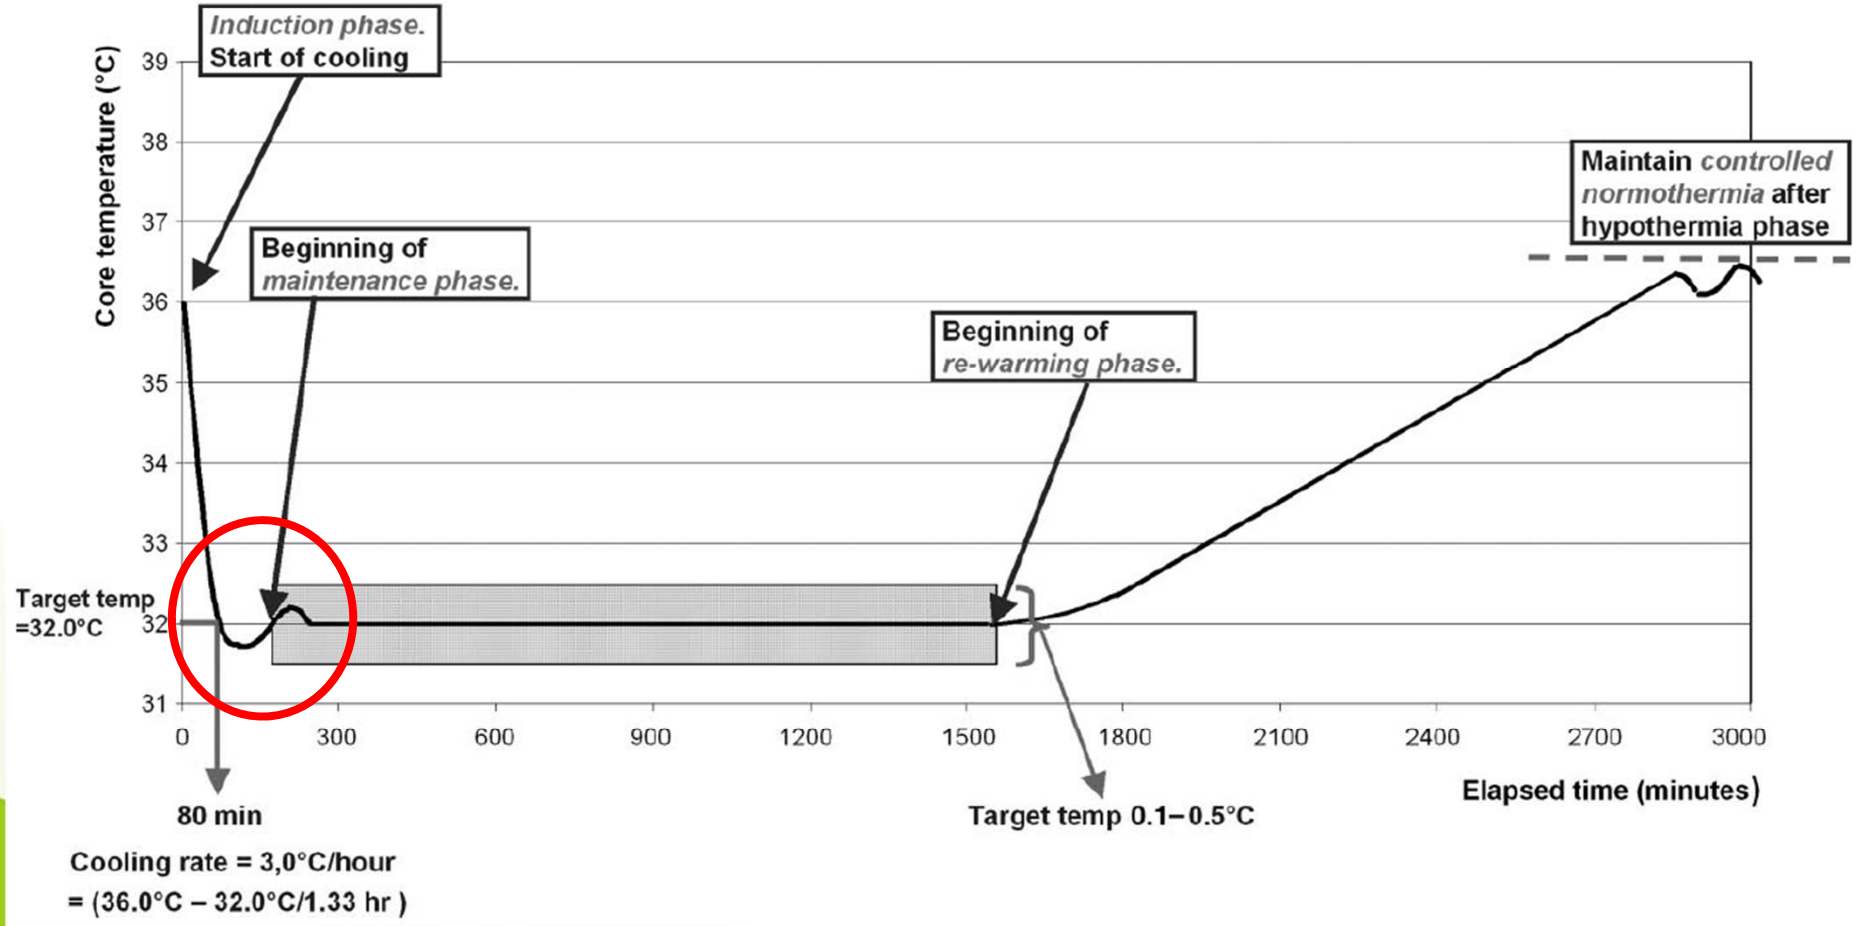
Where to measure temperature?

Temperature Monitoring





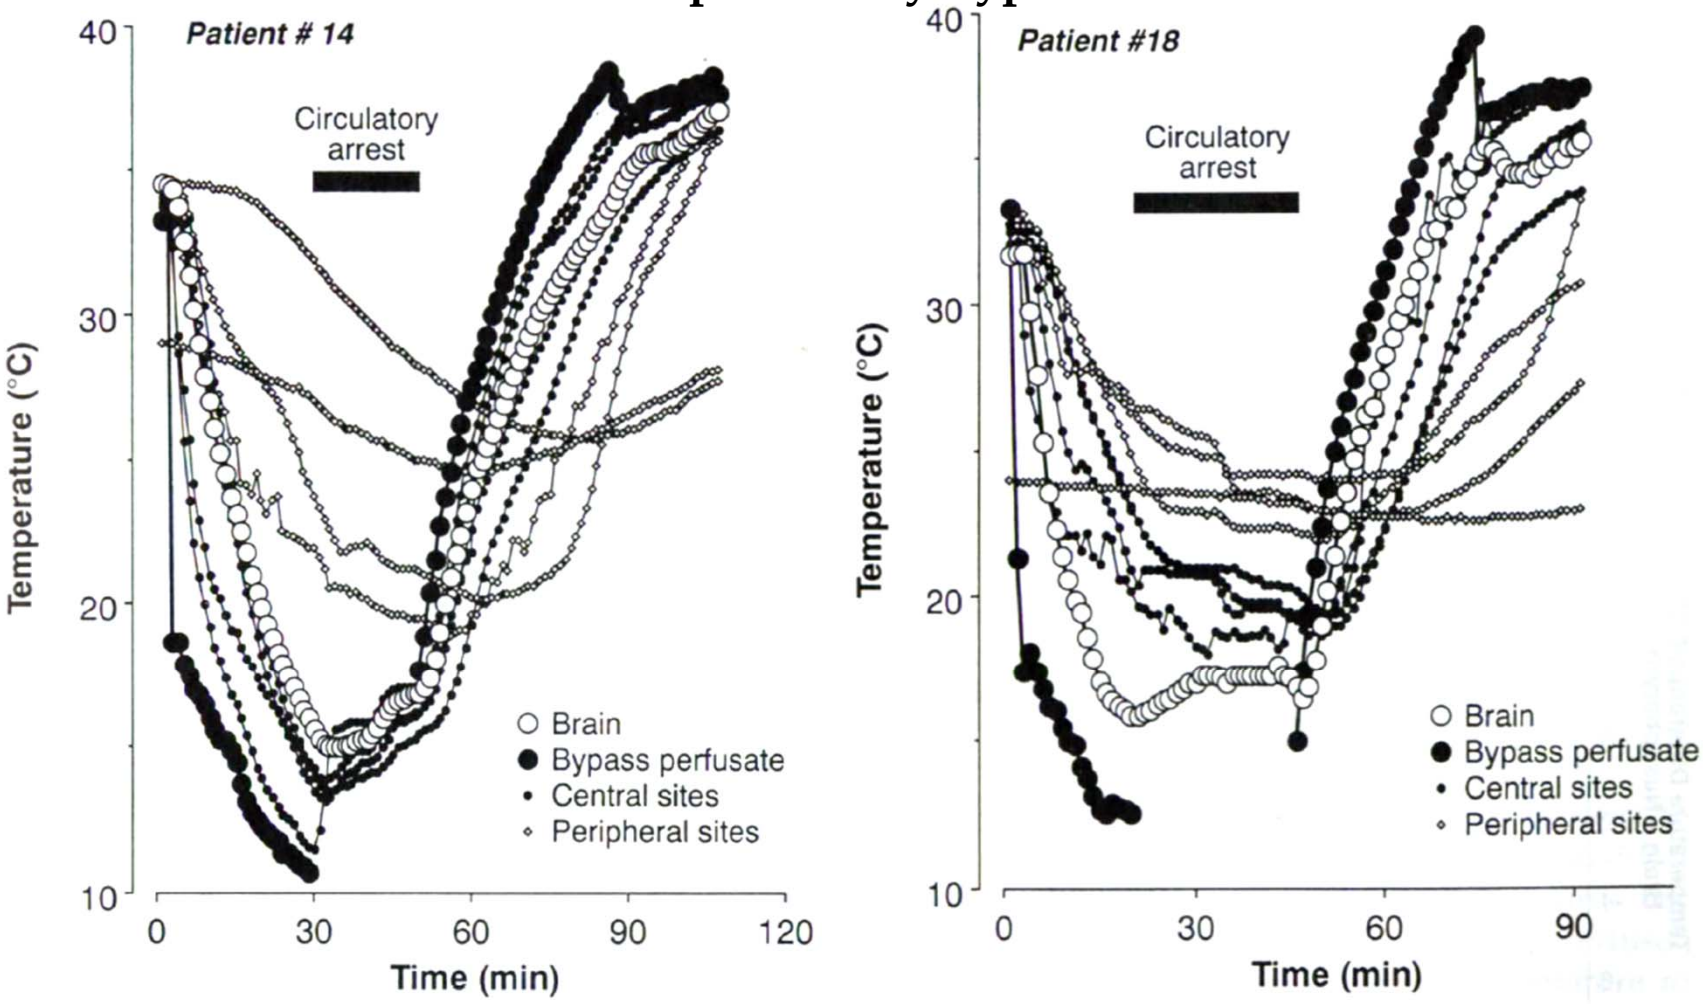
Overshoot During Rapid Induction



Polderman KH. ***Crit Care Med*** **2009;37(Suppl): S186202**

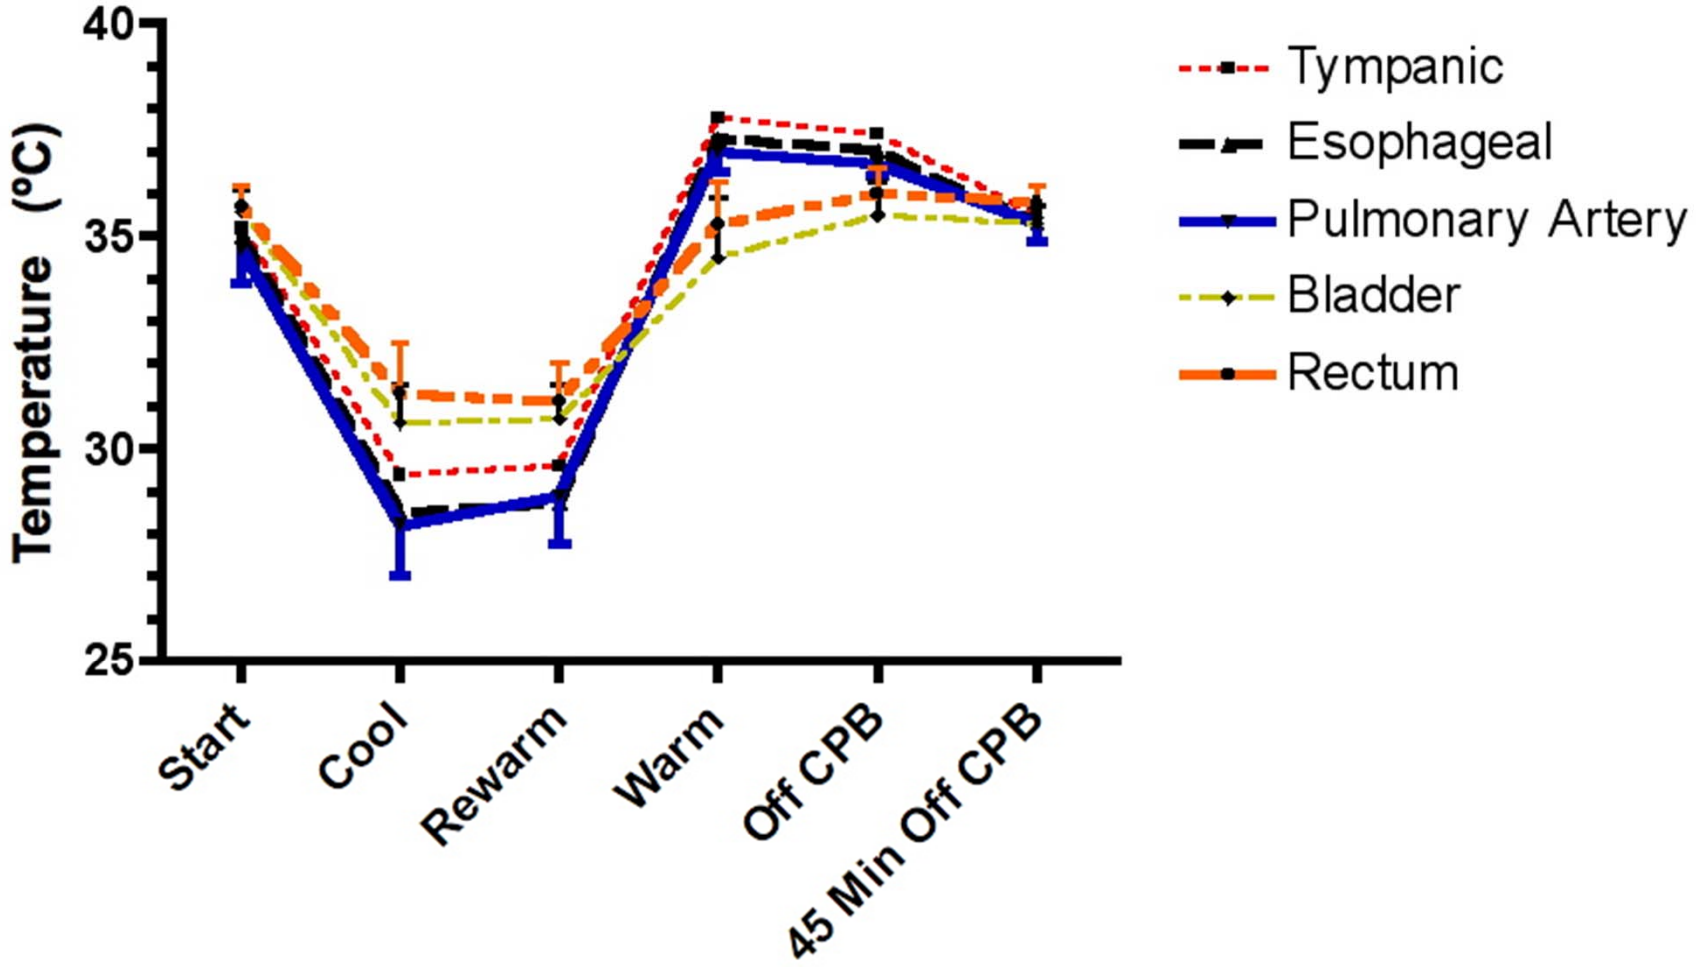
Brain vs. Central vs. Peripheral

On Cardiopulmonary Bypass (CPB)



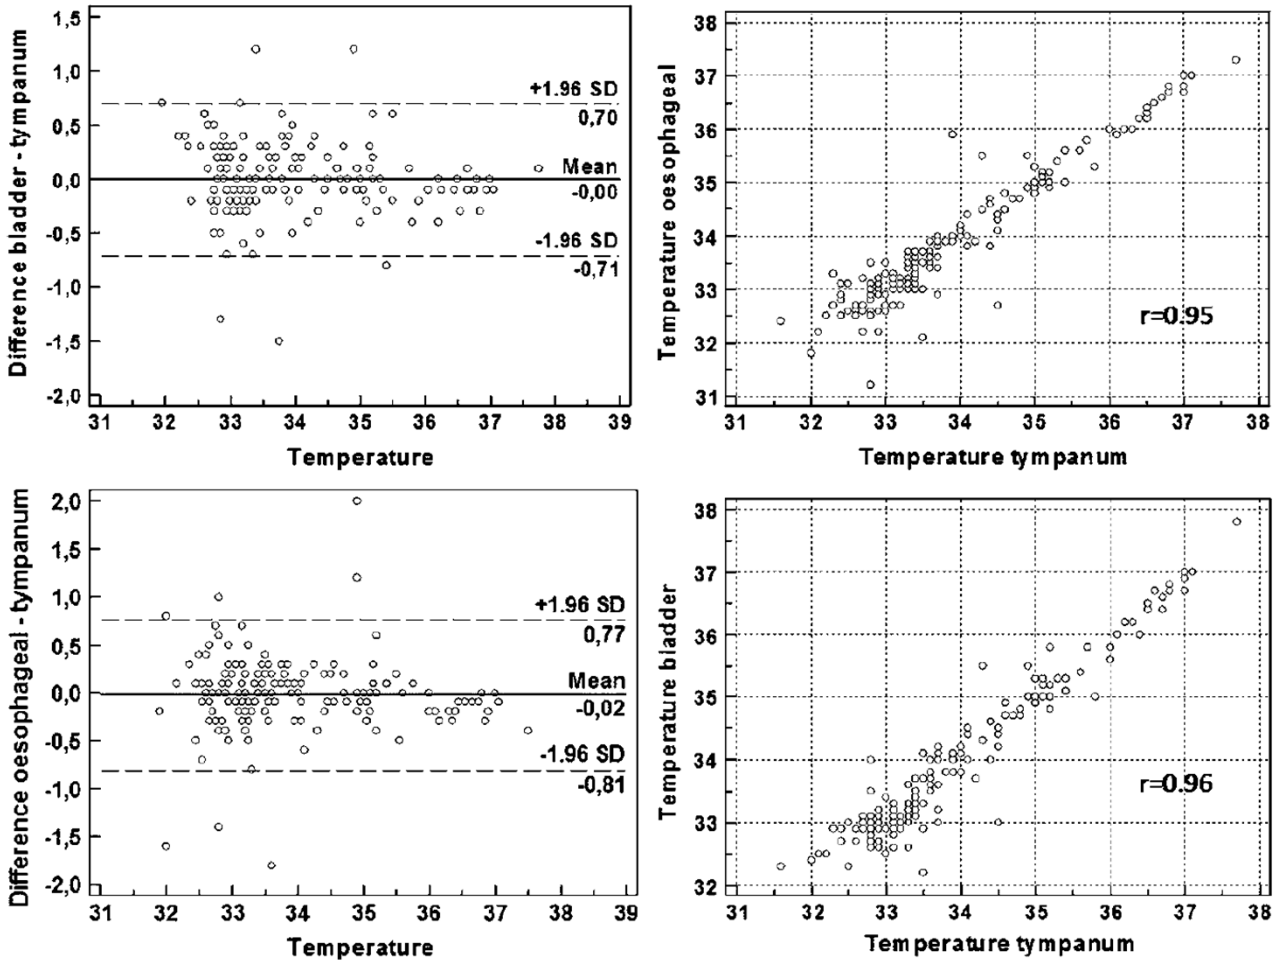
Stone JG, et al. *Anesthesiology* 1995;82:344-51

Time Lag On CPB



Pujol et al. ***J Cardiothorac Vasc Anesthesia*** **1996;10:336-43**

Tympanic Temperature during TH



Hasper D, et al. *Emerg Med J* 2010; article in press.

Recommended Temperature Monitoring Sites

1. PA catheter (gold standard)
2. Esophageal (lower esophagus)
3. Bladder (unless anuric)
4. TM or Nasopharyngeal (short-term use)
5. Rectal (maintenance and rewarming)

Current TH Setting (Seoul St. Mary's)

Take-Home Message

- Many questions remain unanswered
- Easy to perform and lacks severe adverse effects
- Initiated as early as possible for the indicated patients
- Combine core and surface cooling methods
- Aware physiological changes and prevent potential side effects
- Carefully monitor core temperatures at central sites

Thank You !
