Solution to Reduce CV risk:

Exploring the latest pathway to treat Hypertension & Dyslipidemia

- **Reducing cardiovascular risk in high-risk patients**

: How we would apply new treatment guideline in a real practice?

(연세의대 최동훈 교수님)

- **The Significance of Uric acid for Hypertension treatment**

(연세의대 강석민 교수님)

Reducing cardiovascular risk in high-risk patients

: How we would apply new treatment guideline in a real practice?

1. Global treatment guideline changes to more aggressive treatment.

- Three points of updates in 2011 ESC/EAS guideline are
 - a. It is importance to get to LDL-C <70mg/dL or 50% reduction from baseline for high-risk patients.
 - b. CKD is also CHD equivalent risk factor
 - c. Management of atherogenic particle number is valuable approach for Metabolic syndrome and DM patients (non-HDL and ApoB is secondary target)

2. 80% of CHD patients are not at LDL-C goal(<70mg/dL) with statin in Korea

- Because, Statin mono therapy has some limitation to get to target goal at once.
 - a. Safety concern of high dose statin: hepatic and muscle injury
 - b. Lack of additional value of doubling or switching: Rule of six
 - c. (Risk of incident diabetes (FDA warning, 2012))

Reducing cardiovascular risk in high-risk patients

: How we would apply new treatment guideline in a real practice?

3. VYTORIN is the smart option to be aligned with guideline change.

- VYTORIN proved superior efficacy vs. statin therapy (mono, doubling or switching)
 - a. 9 out of 10 patients are getting to goal at once with initial dose of VYTORIN.
 - b. Initial dose of VYTORIN cut off 50% reduction LDL-C at once.
(EZT add-on to any statin provided additional 25% reduction of LDL-C.)
 - c. EZT/VYTORIN attained triple target goal for managing atherogenic particle vs. statin mono therapy.

- VYTORIN proved long-term clinical benefits for high-risk patients safely.
 - a. Initial dose of VYTORIN (10/20mg) proved 17% risk reduction of atherosclerotic event (coronary death, non-fatal MI, non-hemorrhagic stroke and any revascularization) in patients with high-risk patients.
 - b. VYTORIN had proved safety profile for highest risk patient such as CKD in 5 years.

Reducing cardiovascular risk in high-risk patients

: How we would apply new treatment guideline in a real practice?

4. EZT / VYT provide additional benefits beyond LDL-C

- EZT / VYTORIN is better option for minimizing concern of increasing DM vs. statin.
 - a. Based on RCT and meta analysis, statin (rosuvastatin, atorvastatin) seems to be associated with development of DM (meta-analysis data)
 - b. In animal and human data, EZT / VYTORIN proved no deleterious effect on insulin resistance
 - c. In SHARP, no report on DM incidence vs. placebo.

- EZT / VYTORIN improved endothelial function.
 - a. Low dose Simvastatin and Eze preserved post-fat load endothelial function in male MS patients.
 - b. Ezetimibe improves postprandial induced endothelial dysfunction.
 - c. Impact of Ezetimibe therapy on Endothelial Dysfunction in patients on statin therapy with CAD and hyperTG.

***Reducing cardiovascular risk in high-risk patients
: How we would apply new treatment guideline in a real practice?***

[Take Home Message]

VYTORIN is the smart option to be aligned with guideline change.

1. For better goal achievement, VYTORIN 10/20mg cut off 50% LDL-C reduction safely at once.
2. VYTORIN attained triple target goal for managing atherogenic particle vs. statin mono therapy
3. Reduction of LDL cholesterol with VYTORIN 10/20mg safely reduced the incidence of major atherosclerotic events in high-risk patients.

Reducing cardiovascular risk in high-risk patients
: How we would apply new treatment guideline in a real practice?

Lower Is Better : Cholesterol Treatment Trialists

2004 NCEP ATP III guideline

Risk Category	LDL-C Goal	Initiate TLC	Consider Drug Therapy
High risk: CHD or CHD risk equivalents (10-year risk 20%)	<100 mg/dL (optional goal: <70 mg/dL)	≥100 mg/dL	≥ 100 mg/dL (100 mg/dL: consider drug options)
<i>Moderately high risk: 2 risk factors</i> (10-year risk 10% to 20%)	<130 mg/dL (optional goal: <100mg/dL)	≥ 130 mg/dL	≥ 130 mg/dL (100–129 mg/dL; consider drug options)
<i>Moderate risk: 2 risk factors</i> ‡ (10-year risk 10%)	<130 mg/dL	≥130 mg/dL	≥ 160 mg/dL
<i>Lower risk: 0–1 risk factor</i> §	<160 mg/dL	≥160 mg/dL	≥ 190 mg/dL (160–189 mg/dL: LDL-lowering drug optional)

*CHD includes history of myocardial infarction, unstable angina, stable angina, coronary artery procedures (angioplasty or bypass surgery), or evidence of clinically significant myocardial ischemia.

†**CHD risk equivalents** include clinical manifestations of noncoronary forms of atherosclerotic disease (peripheral arterial disease, abdominal aortic aneurysm, and carotid artery disease transient ischemic attacks or stroke of carotid origin or 50% obstruction of a carotid artery), **diabetes**, and 2 risk factors with 10-year risk for hard CHD 20%.

‡Risk factors include cigarette smoking, hypertension (BP 140/90 mm Hg or on antihypertensive medication), low HDL cholesterol (40 mg/dL), family history of premature CHD (CHD in male first-degree relative 55 years of age; CHD in female first-degree relative 65 years of age), and age (men 45 years; women 55 years)

TABLE 2. ATP III LDL-C Goals and Cutpoints for TLC and Drug Therapy in Different Risk Categories and Proposed Modifications Based on Recent Clinical Trial Evidence (*Circulation*. 2004;110:227-239.)

2011 ESC Update :

Updated recommendations for Very high risk

- Very high risk
 - **Documented CVD, previous MI, ACS, coronary revascularization** (PCI, CABG) and other arterial revascularization procedures, ischemic stroke, PAD
 - Patients with **type 2 diabetes**, patients with type 1 diabetes with target organ damage (such as microalbuminuria)
 - **Patients with moderate to severe CKD** (GFR < 60mL/min/1.73m²)
 - A calculated 10 year risk SCORE ≥ 10%

- Treatment targets
 - Primary target – LDL-C
 - In patients at VERY HIGH CV risk ² **the LDL-C goal is < 70mg/dL and/or ≥ 50% LDL-C reduction** when target level cannot be reached
 - Secondary target ³
 - Specific target for **non-HDL-C** should be 30mg/dL higher than the corresponding LDL-C target.
 - **Apo B** appears to be a risk factor at least as good as LDL-C and a better index of the adequacy of LDL-lowering therapy than LDL-C

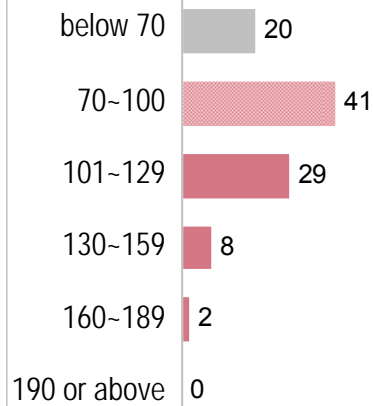

Therefore, 80% of CHD patients are not at the goal even with Statin Rx in Korea

LDL-C distribution

❖ LDL-C Uncontrolled after Statin Rx.

Total
(n=925)

LDL-C distribution by CV disease

[Base: Pts have LDL-C after Statin Rx., Unit: %]

CHD
(n=526)

CHD equivalent (=DM)
(n=118)

HTN with 2 more risk*
(n=201)

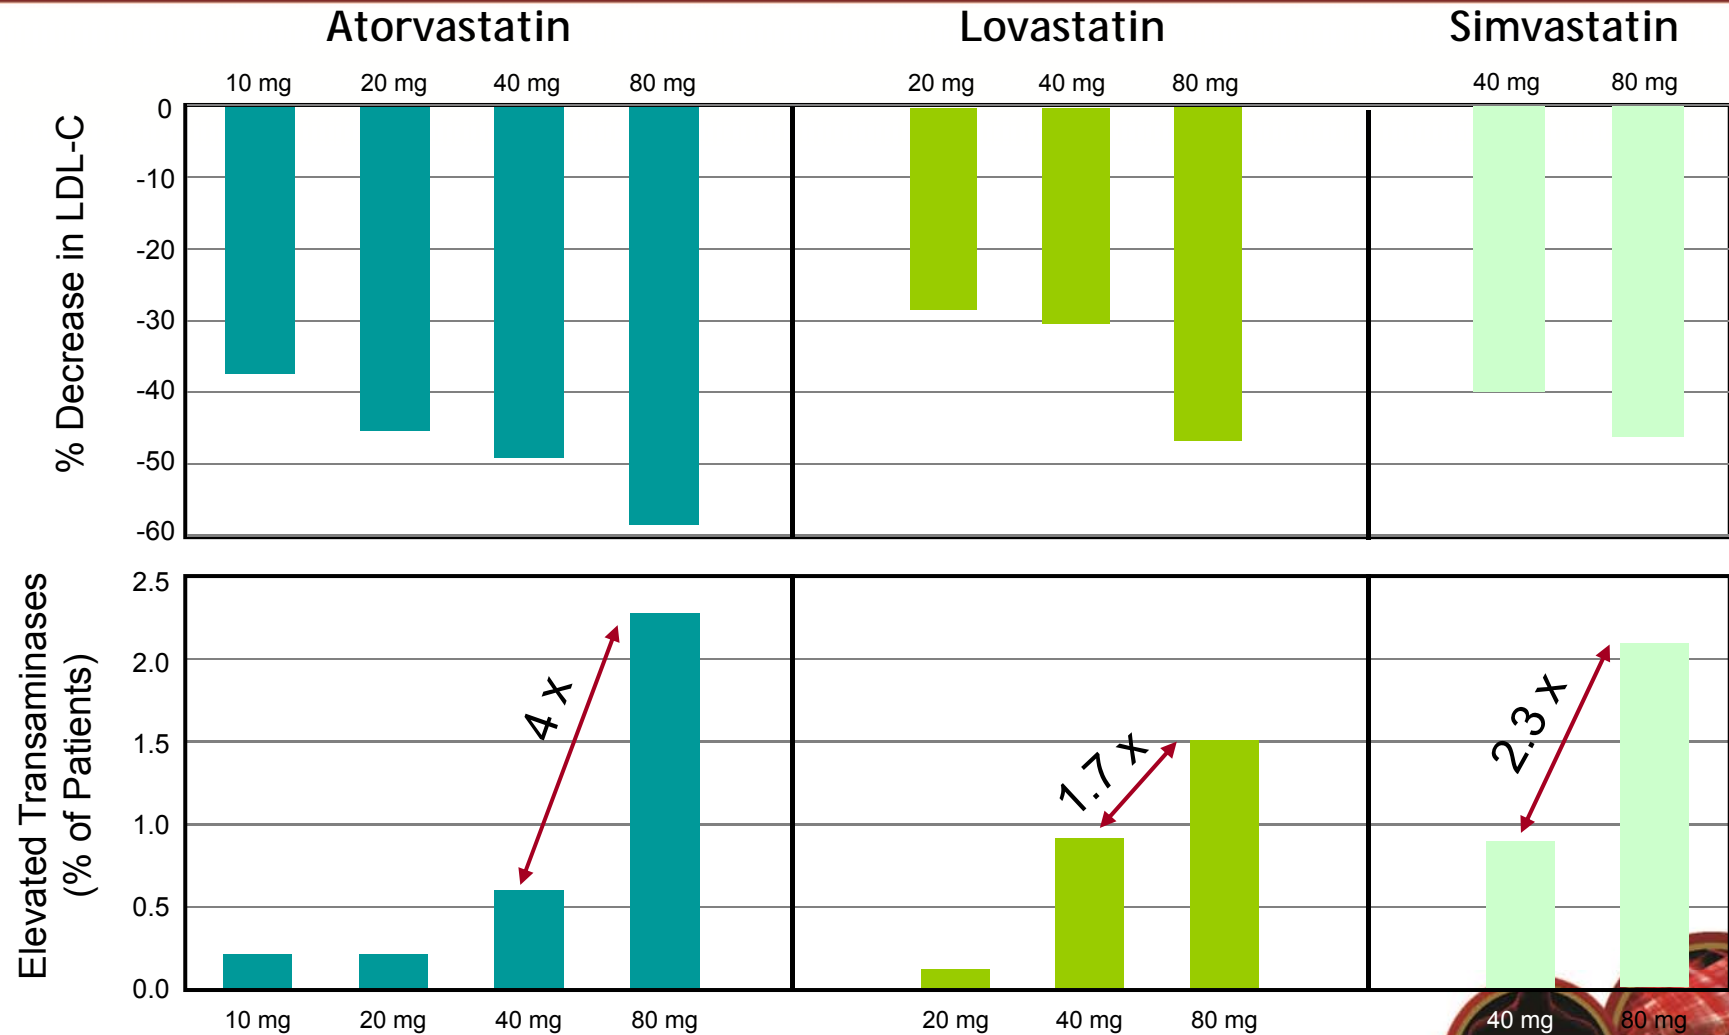

No Risk
(n=80)

Only highest dose of statins can achieve 50% LDL-C reduction

Highest doses associated with increased hepatic toxicity

Data from prescribing information for atorvastatin, lovastatin, simvastatin.
This does not represent data from a comparative study.

Highest doses associated with increased muscle injury (> 10X CK)

Statin up-titration has limitation on LDL-C reduction

“...With each doubling of the dose of statin, LDL-C levels fall by about 6 percent.”

NCEP ATP III Final Report

Effect of statin therapy on LDL-C levels: “The Rule of 6”

1. Bays H, Dujovne C. *Expert Opin Pharmacother* 2003;4:779-790.

What is your option to reach target goals (LDL-C < 70mg/dL or $\geq 50\%$ reduction)?

1

Escalation of Statin dose ?

2

Utilization of dual action mechanism?

Ezetimibe : The 1st cholesterol absorption inhibitor

Fig. 4. Bovine bone formation is attributable to human cells (A and B) isolated from an implant seeded with an NPC1L1 clone targeted at the intestinal absorption site. Human cells were stained brown with an antibody to human osteocalcin to identify human osteoblasts in the bone matrix. (C) Control sections from an implant seeded with mouse MSCs and stained for human osteocalcin. (D) An implant seeded with an NPC1L1 clone targeted at the intestinal site and stained with an antibody to human collagen type I. (E) Control implant seeded with mouse MSCs and stained for human collagen. Scale bars, 25 μ m.

Niemann-Pick C1 Like 1 Protein Is Critical for Intestinal Cholesterol Absorption
Scott W. Altmann,^{1*} Harry R. Davis Jr.,¹ Li-Ji Zhu,¹ Xiangyi Yao,¹ Linbeth M. Hoon,¹ Gian Tattolari,¹ Sai Prasad N. Iyer,¹ Harwanan Nigam,¹ Anind Ghoshal,² Ming Zhang,¹ Luquan Wang,² Nicholas Murgolo,² Michael F. Costanzo¹

Dietary cholesterol consumption and intestinal cholesterol absorption contribute to plasma cholesterol levels, a risk factor for coronary heart disease. The molecular mechanism of dietary uptake from the lumen of the small intestine is poorly defined. We show that Niemann-Pick C1 Like 1 (NPC1L1) protein plays a critical role in the absorption of intestinal cholesterol. NPC1L1 expression is enriched in the small intestine and is in the brush border membrane of enterocytes. Although otherwise phenotypically normal, NPC1L1-deficient mice exhibit a substantial reduction in absorbed cholesterol, which is reflected by dietary supplementation with oleic acid. Ezetimibe, a drug that inhibits cholesterol absorption, had no effect on NPC1L1 knock-out mice, suggesting that NPC1L1 is an essential, sensitive pathway responsible for intestinal cholesterol absorption.

away from the brush border directing the production of cholesterol ester by NPC1L1. NPC1L1-deficient mice appear to be deficient in the brush border membrane in human, cholesterol absorption occurs in the proximal jejunum of the small intestine, where both dietary cholesterol and dietary cholesterol ester are available for uptake into the intestinal lumen. The brush border membrane of cholesterol absorbers (1), the small intestine (2, 3), and in mammals by drugs such as ezetimibe (4) suggest that the process is mediated by a specific transport protein. However, the identity of this protein-cholesterol transporter has remained elusive.

To identify genes involved in cholesterol uptake, we used a genomic-chip-based approach. Because sequence from gastrointestinal tissues are poorly represented in the public sequence databases, we prepared two cDNA libraries for sequencing: one from rat jejunal mucosal scrapings and the second from jejunal enterocytes isolated by laser capture microdissection (5). The ~14,500 expressed sequence tags (ESTs) derived from these libraries were combined with all available public rat ESTs and were analyzed by cross-hybridizing to rat sequences with both mouse and human data. This sequence database was analyzed for all transcripts containing features associated to a cholesterol transporter, i.e., sequence prediction of transmembrane domains, cytoskeletal signal peptides, and ³H-labeled glycosylation sites as well as known cholesterol-binding motifs such as sterol-binding domain (6, 7). Only one candidate gene emerged from this analysis: the rat homologue of NPC1L1 (8). Human NPC1L1 has several of the predicted features of a plasma membrane transport protein including a sterol signal, 12 predicted

Additional benefit of Ezetimibe beyond LDL-C

1. Better option for minimizing concerns of increasing DM
2. Improvement of endothelial dysfunction

FDA Expands Advice on **STATIN RISKS**

- Altoprev (lovastatin extended-release)
- Crestor (rosuvastatin)
- Lescol (fluvastatin)
- Lipitor (atorvastatin)
- Livalo (pitavastatin)
- Mevacor (lovastatin)
- Pravachol (pravastatin)
- Zocor (simvastatin).
- Advicor (lovastatin/niacin extended-release)
- Simcor (simvastatin/niacin extended-release)
- Vytorin (simvastatin/ezetimibe).

- A small increased risk of raised blood sugar levels and the development of Type 2 diabetes have been reported with the use of statins.
- “Clearly we think that **the heart benefit of statins outweighs** this small increased risk,” says Egan.
- But what this means for patients taking statins and the health care professionals prescribing them is that **blood-sugar levels may need to be assessed** after instituting statin therapy,” she says.

Higher doses of statins are associated with new-onset Diabetes

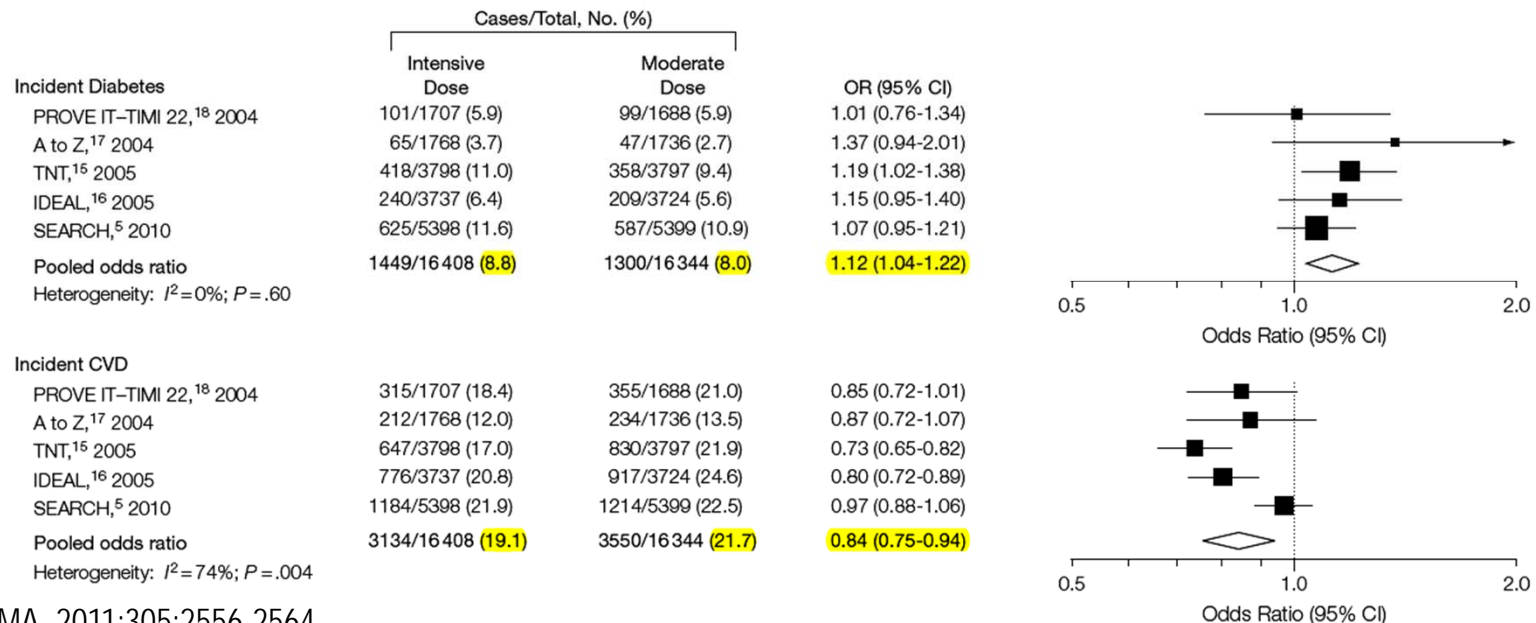

Risk of Incident Diabetes With Intensive-Dose Compared With Moderate-Dose Statin Therapy

A Meta-analysis

In a pooled analysis, intensive-dose statin therapy was associated with an increased risk of new-onset diabetes compared with moderate-dose statin therapy.

- As compared with moderate-dose statin, the number needed to harm per year for intensive-dose statin was **498 for new-onset DM** while the number needed to treat per year for intensive-dose statin was **155 for C-V events**.

Figure 2. Meta-analysis of New-Onset Diabetes and First Major Cardiovascular Events in 5 Large Trials Comparing Intensive-Dose to Moderate-Dose Statin Therapy

Preiss D, JAMA. 2011;305:2556-2564

Data marker size indicates relative weight of the studies; OR, odds ratio; and CI, confidence interval.

Ezetimibe might be good option for reducing risk of high dose statin on insulin resistance

In animal data

- Ezetimibe might decrease hepatic insulin resistance by reducing hepatic cholesterol

Am J Physiol Endocrinol Metab (2009) 297: E1030–E1038

In Human data

- Ezetimibe, inhibiting molecules of NPC1L1 improved HOMA-IR compared with baseline in NAFLD patients

J Gastroenterol (2011) 46:101–107

The mechanism of improved HOMA-IR might be related with inhibition of hepatic NPC1L1 by Ezetimibe

DM

Ezetimibe/statin affect on postprandial TG and lipoproteins

Prospective, randomized, double blind, crossover trial. Male obese metabolic syndrome patients ($n = 19$) were treated with simvastatin 80 mg and simvastatin/ezetimibe 10 mg/10 mg for 6 weeks.

- No treatment, fat load
- After simvastatin 80mg
- ▼ After simvastatin/ezetimibe 10mg/10mg

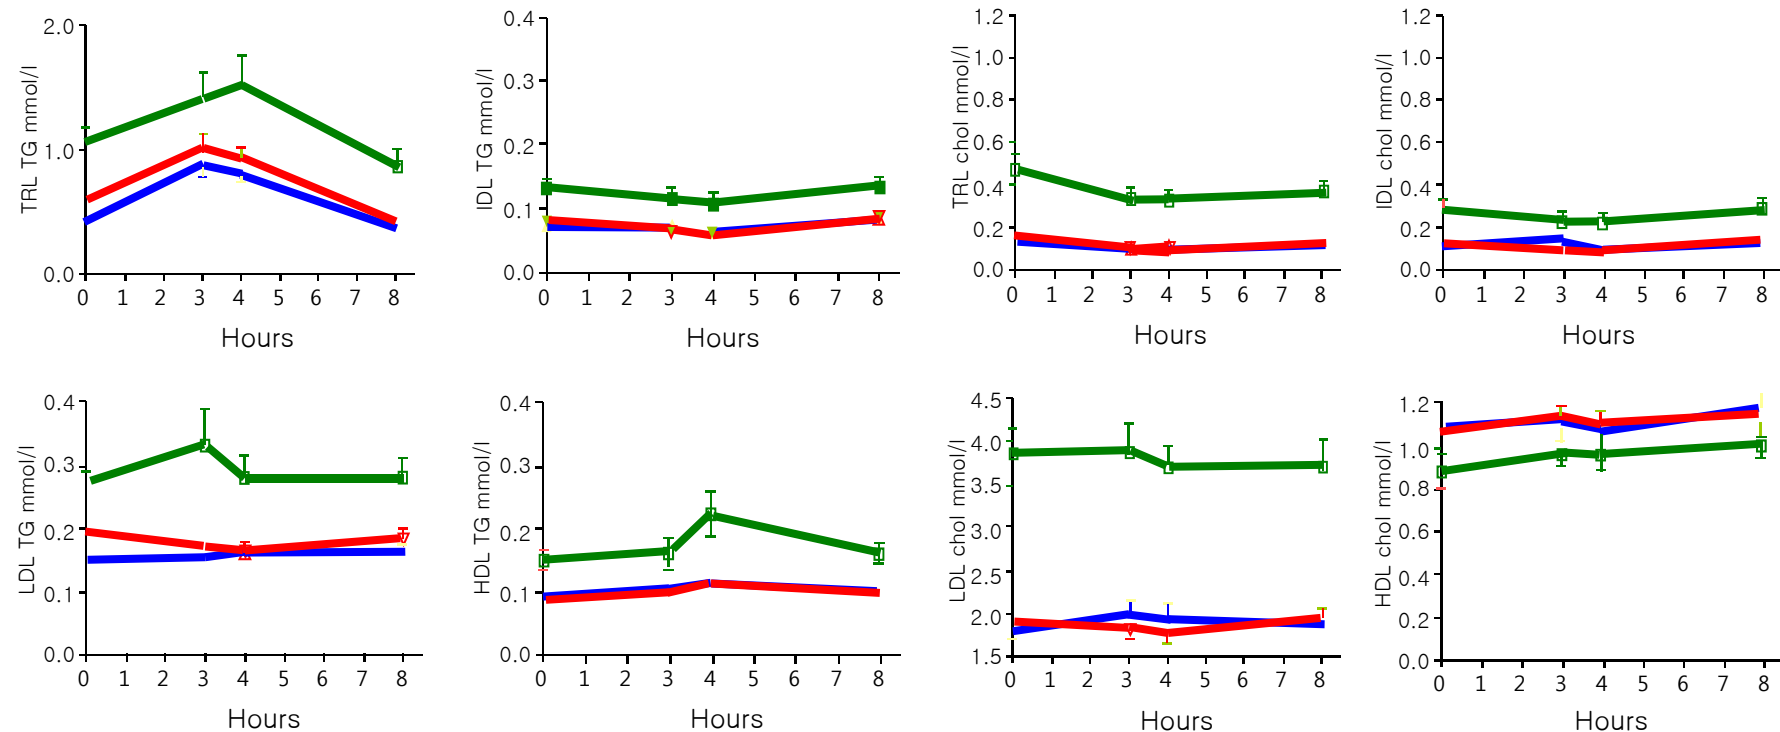

Fig. 1. Postprandial triglyceride content in lipoprotein fractions. Fig. 2. Postprandial cholesterol content in lipoprotein fractions.

Hajer. *Atherosclerosis*. 2008, doi:10.1016/j.atherosclerosis.2008.04.035

Ezetimibe combination therapy is reduced more postprandial TG than mono-statin after comparable LDL-C lowering.

- Randomized, open-label study, 8 weeks of treatment;
- 60 patients with LDL-C > 130 mg/dL and TG 150-499 mg/dL

Take home messages

- For better goal achievement, VYTORIN 10/20mg safely reduced 50% LDL-C from baseline safely at week 6
- VYTORIN achieved non-HDL-C & apo B target goals as well as LDL-C better than statin monotherapy
- VYTORIN 10/20mg reduced incidence of major atherosclerotic events in high risk patients
