TonEBP transcription factor in vascular inflammation

- Implications in therapy and risk assessment

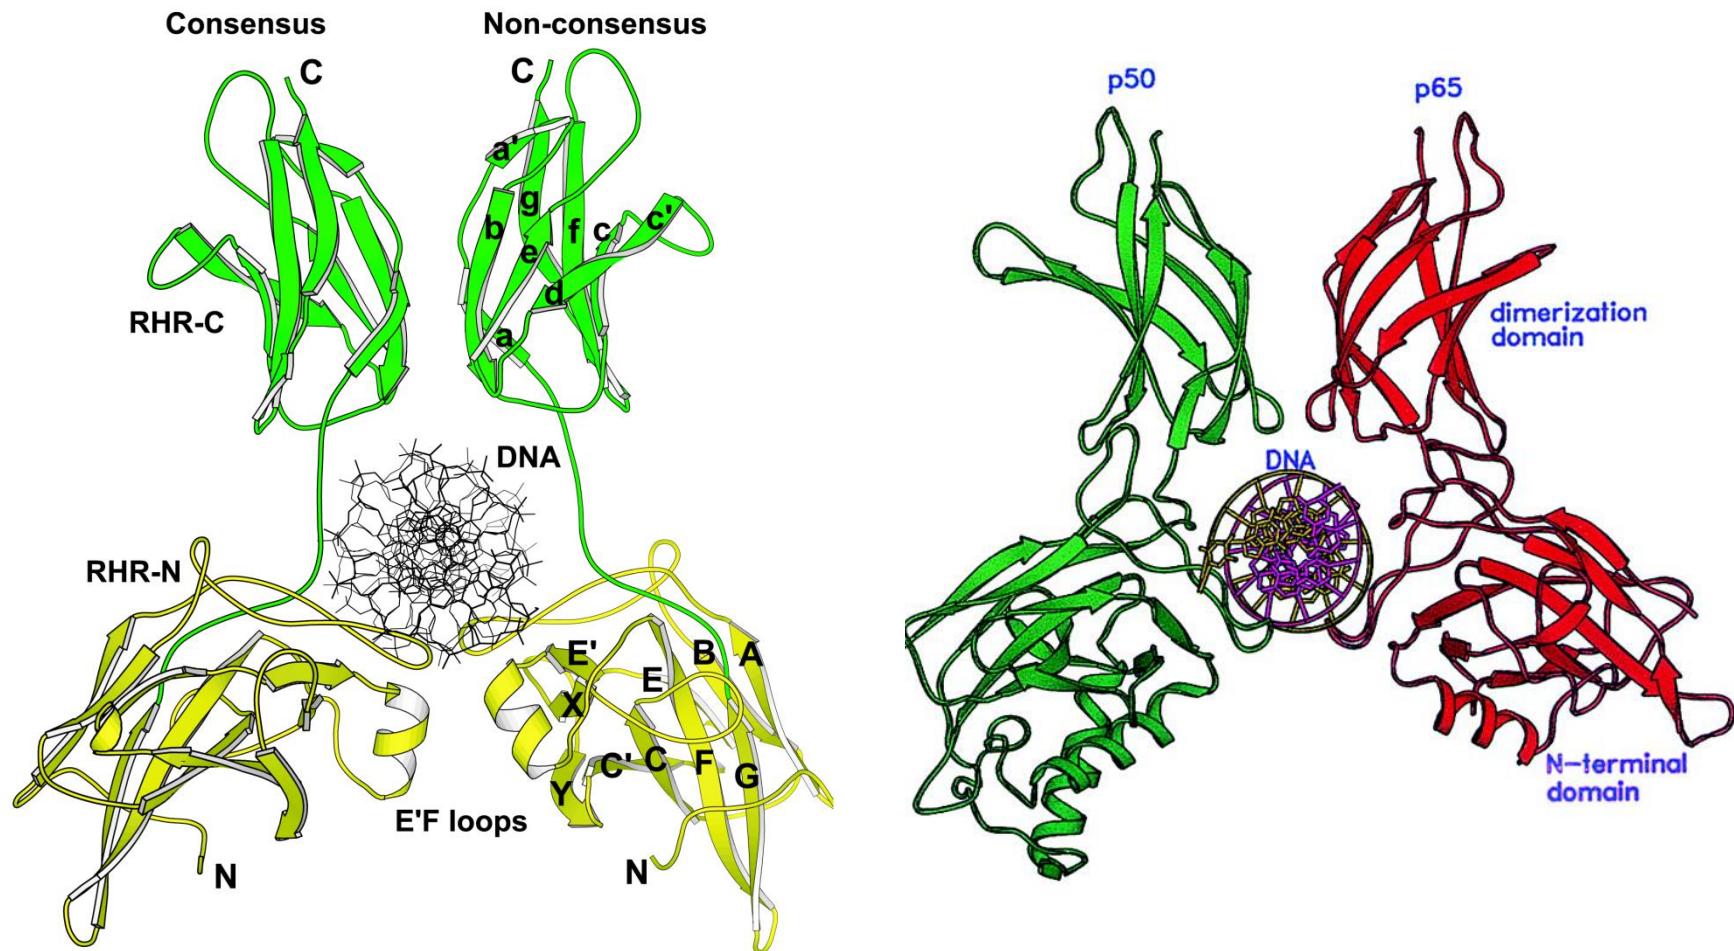

권혁무

울산과학기술원

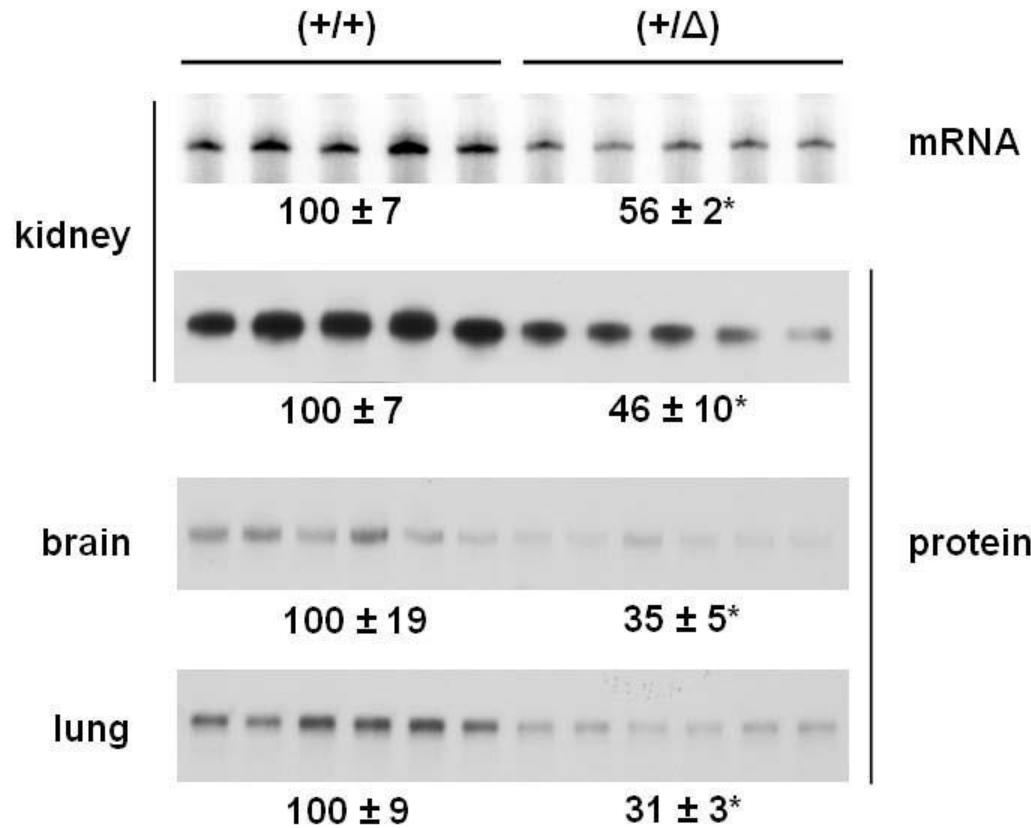

TonEBP contains Rel-homology domain (RHD)

RHDs of TonEBP and NF κ B

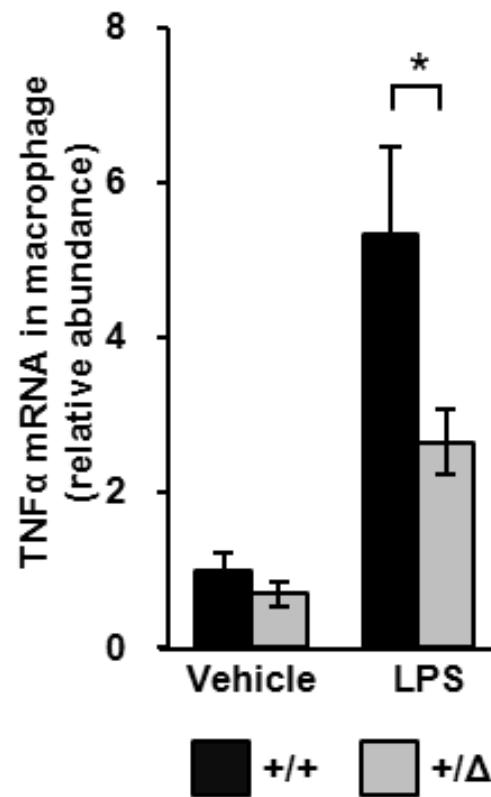

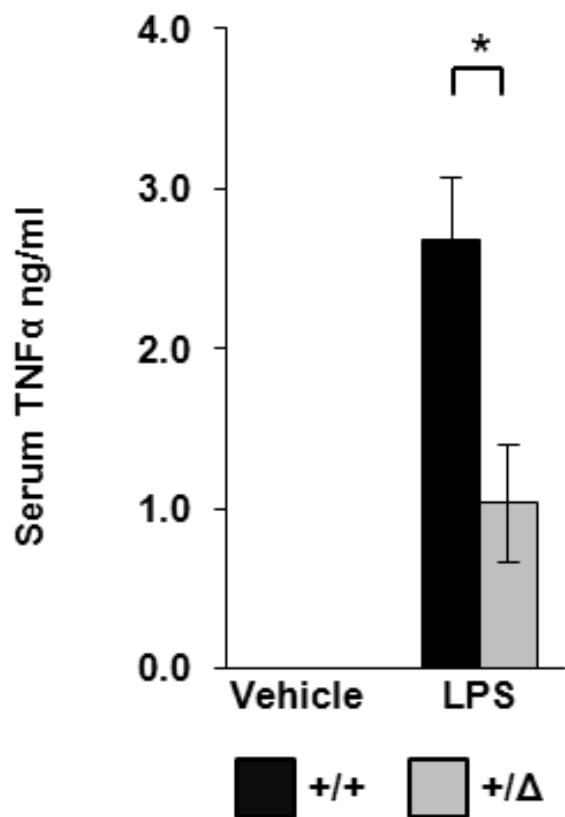

TonEBP haplo-deficiency in *TonEBP^{+/Δ}* mice (+/Δ) compared to their wild type littermates (+/+)

unpublished

Reduced inflammation in TonEBP (+/Δ) mice

(unpublished)

Phenotypes in TonEBP haplo-deficient mice

Published:

- 1. Rheumatoid arthritis.** *Arthr Rheum* 2011
- 2. Atherosclerosis.** *Front Physiol* 2013
- 3. Diabetic retinopathy.** *Exp Eye Res* 2014
- 4. Seizure.** *Cell Death Diff* 2014

Unpublished:

- 1. Diabetic nephropathy**
- 2. Hepatocellular carcinoma**
- 3. Blood Pressure**

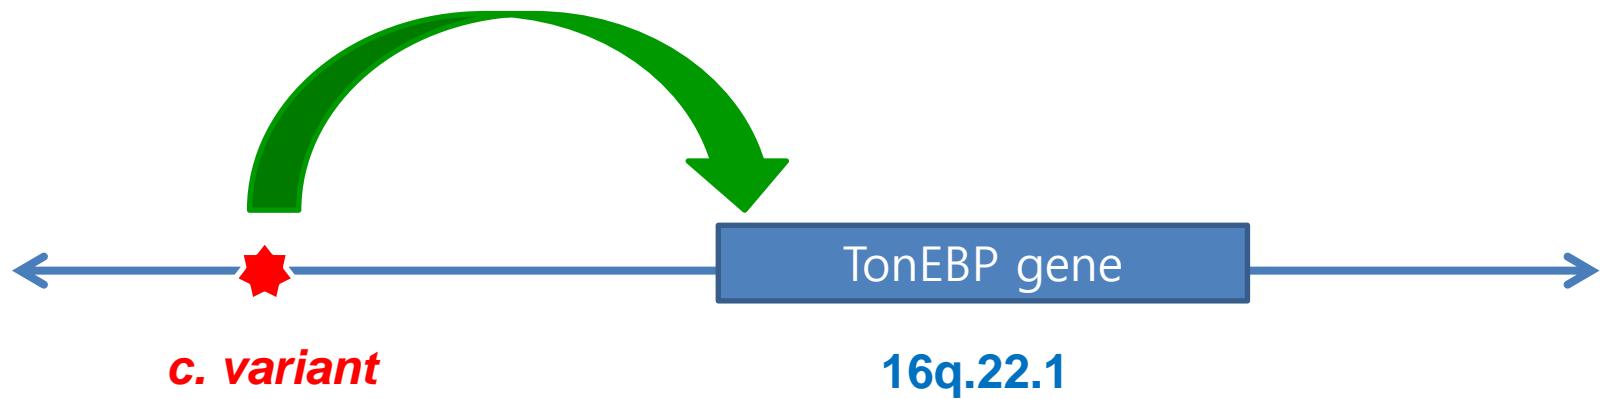

TonEBP gene

- 16q22.1
- 180 kbp
- 80 SNPs

SNPs in the TonEBP gene display association with

- **blood pressure** (Am J Hum Genet 2014)
- **eGFR** (biomarker of diabetic nephropathy) (unpublished)
- **inflammation** (unpublished)
- **atherosclerosis** (unpublished)
- **other phenotypes** (unpublished)

Working Model:
Causative variant and phenotypes

TonEBP ↑ > NFκB ↑
atherosclerosis
rheumatoid arthritis
hepatocellular carcinoma
diabetic nephropathy

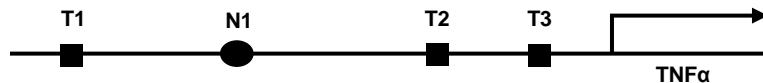

Gene expression induced by Toll-like receptors in macrophages requires the transcription factor NFAT5

(*J Exp Med* 2012)

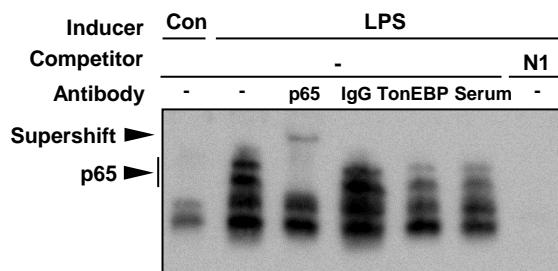

TLR4 > TonEBP ↑ > pro-inflammatory gene expression ↑

TonEBP binds to the κB site of the TNF α promoter without DNA interaction

(unpublished)

Myeloid-specific TonEBP deficiency attenuates LPS-induced macrophage activation and septic shock

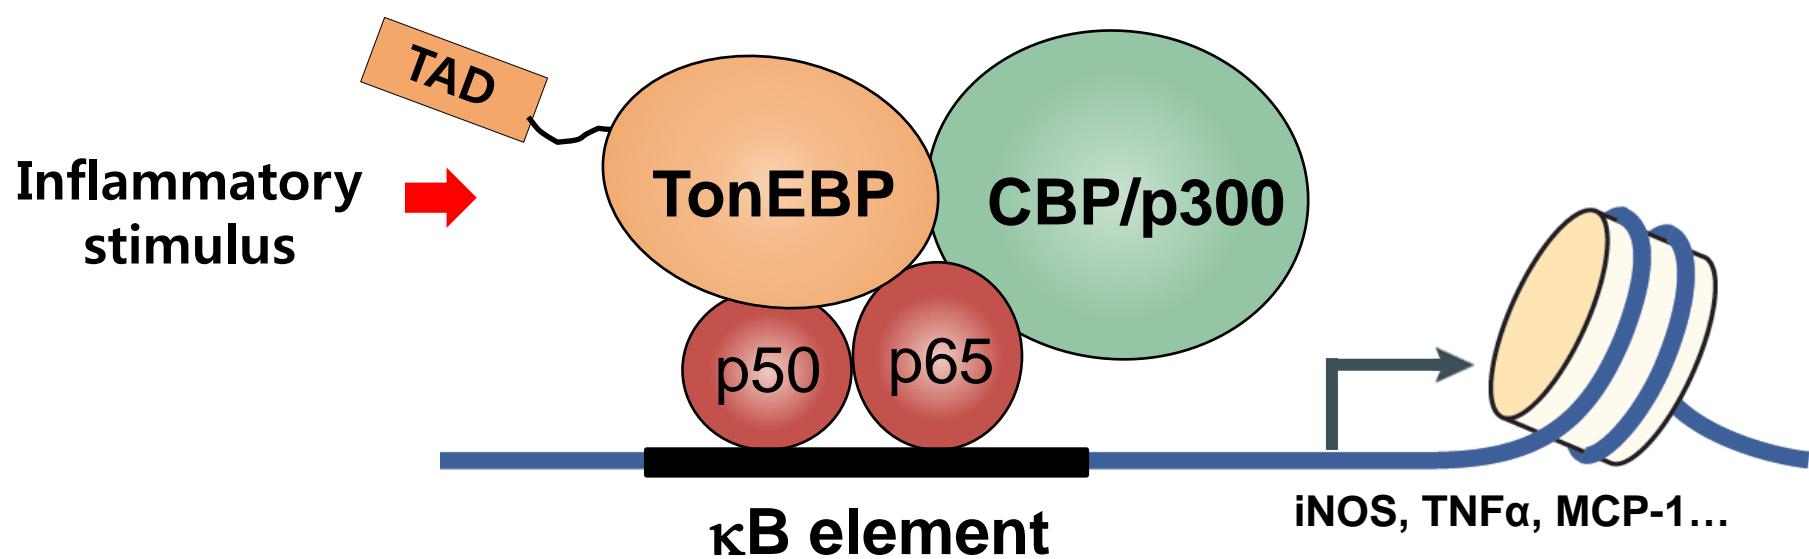

(unpublished)

Summary

TonEBP stimulates LPS-induced NF-κB transcriptional activity by enhancing p300 recruitment

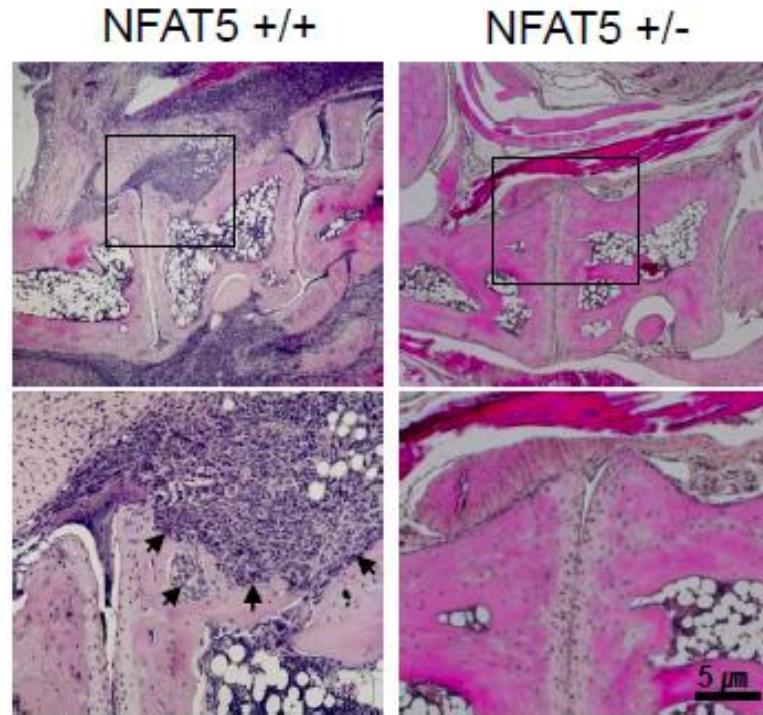

1. TonEBP interacts with NF κ B subunit p65 via RHD-RHD interaction and stimulates NF κ B action.
2. TonEBP binds to κB element through the interaction with p65.
3. TonEBP is required for LPS-induced NF-κB enhanceosome assembly.
4. TonEBP promotes NF κ B-induced septic shock.

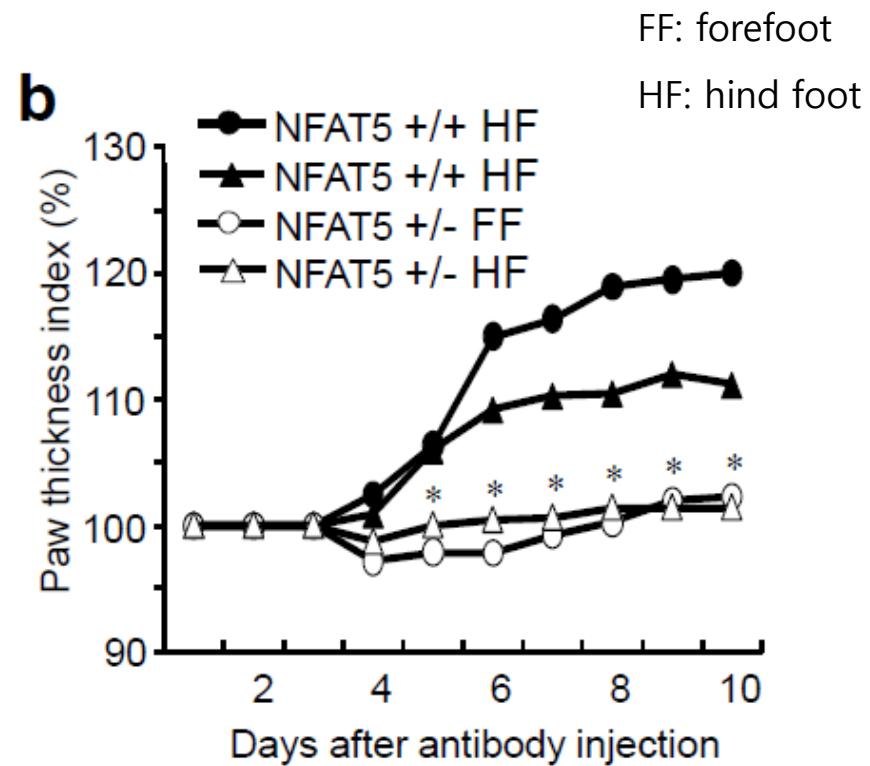

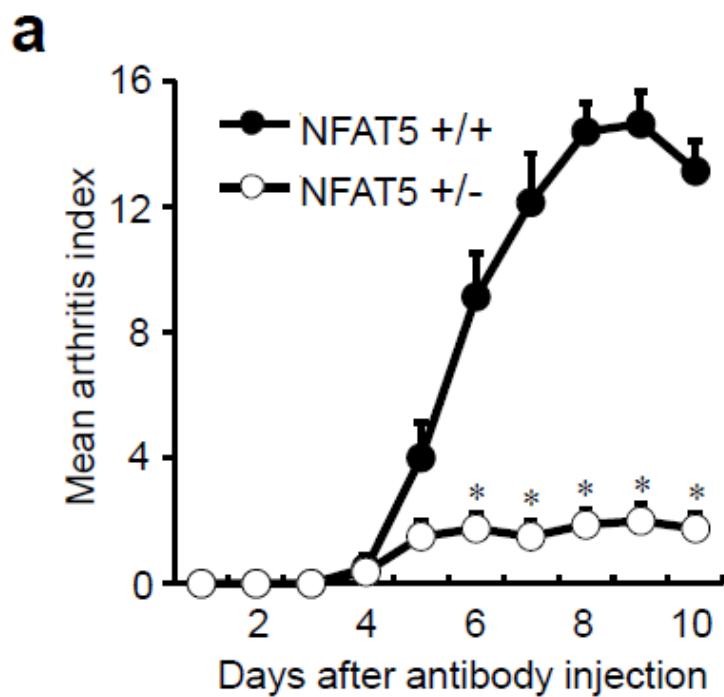

Experimental rheumatoid arthritis (RA) in mice

anti-type II collagen antibodies

RA induced by activation of innate immune system

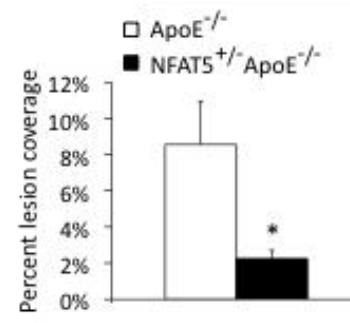

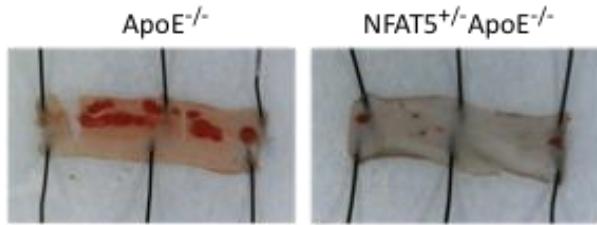

Decrease in arthritis severity in *TonEBP^{+/Δ}* mice

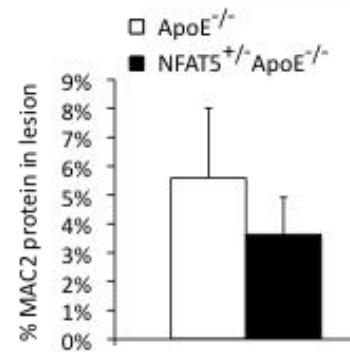

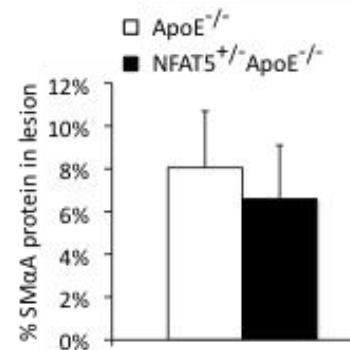

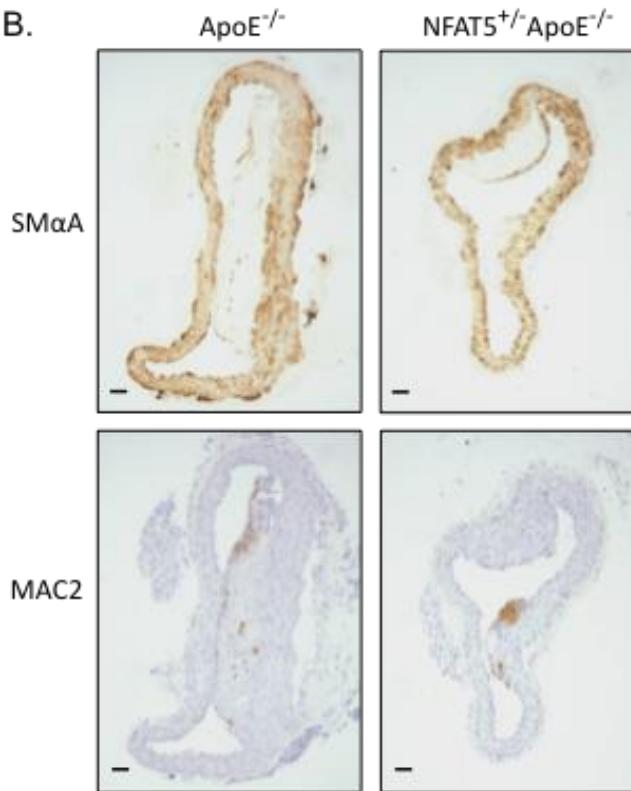

Genomewide TonEBP haploinsufficiency inhibits atherosclerotic lesion formation

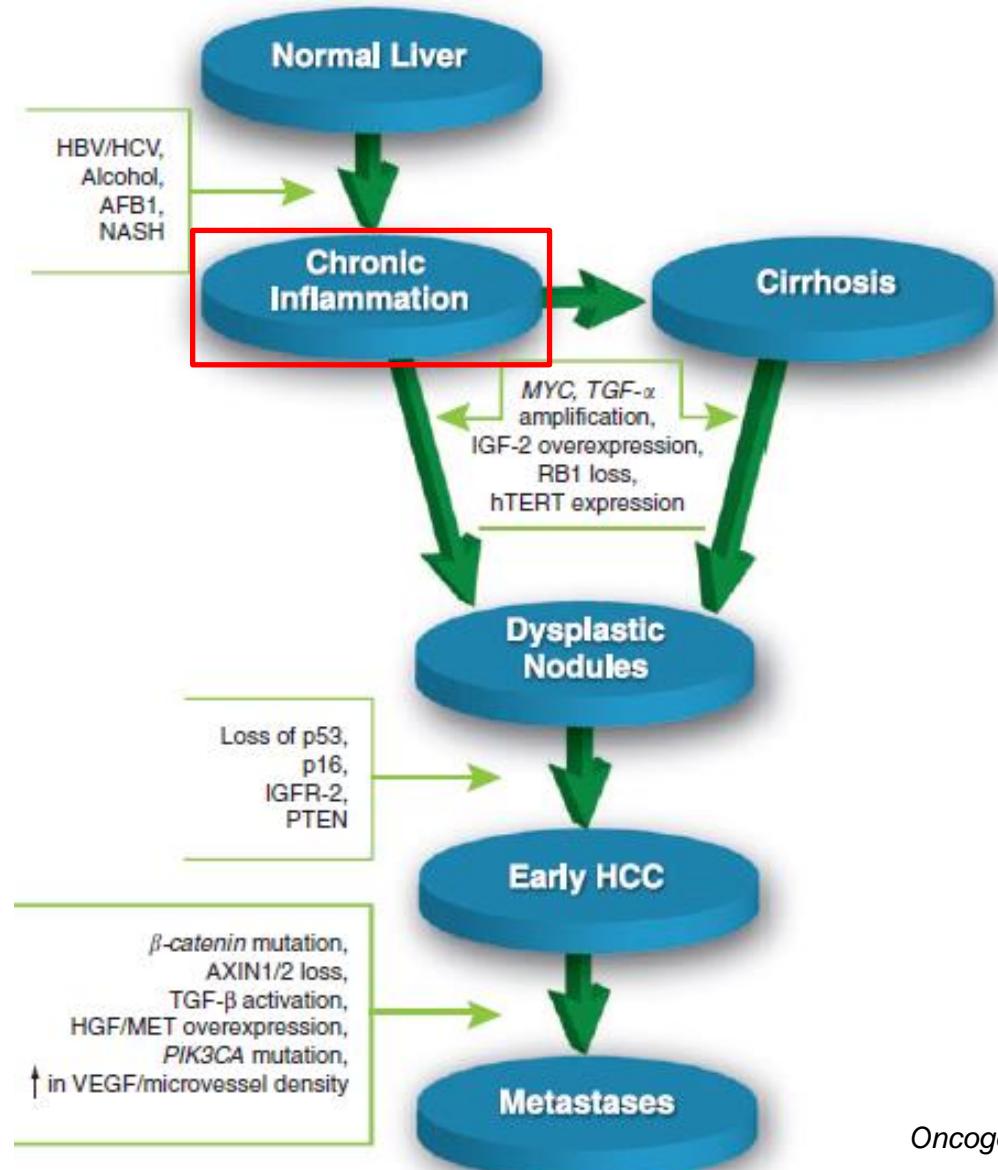

A.

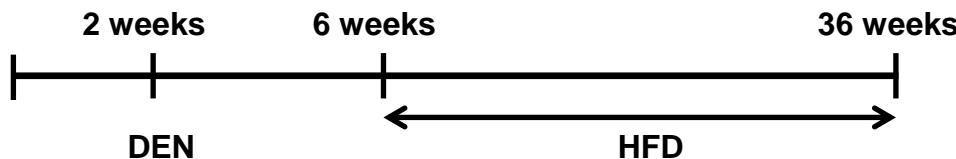

B.

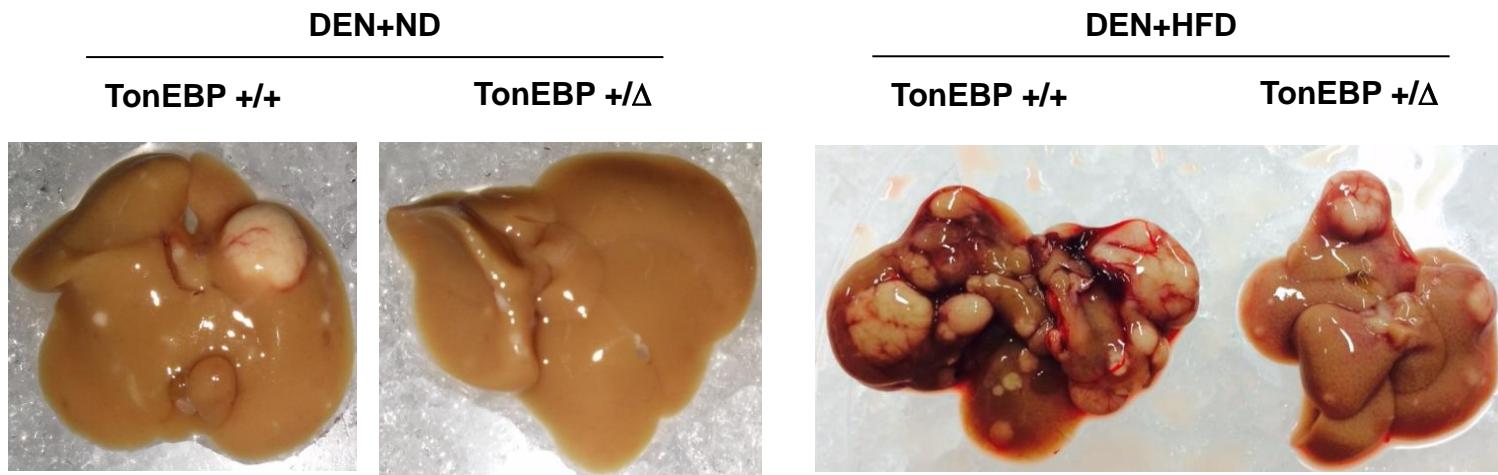

Inflammation and hepatocellular carcinoma

Reduced hepatocellular carcinoma in TonEBP haplo-deficiency

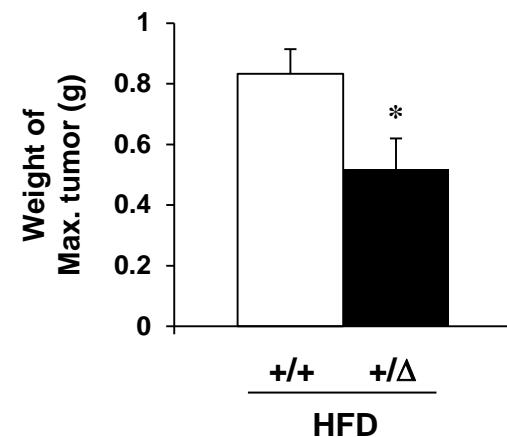

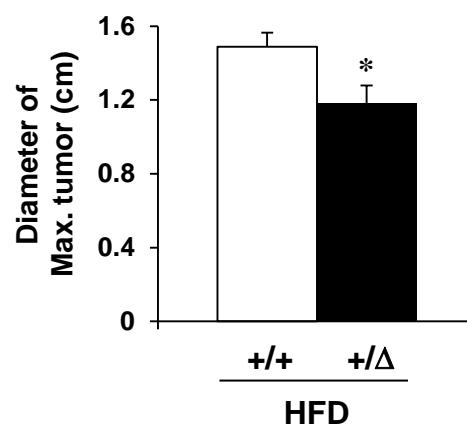

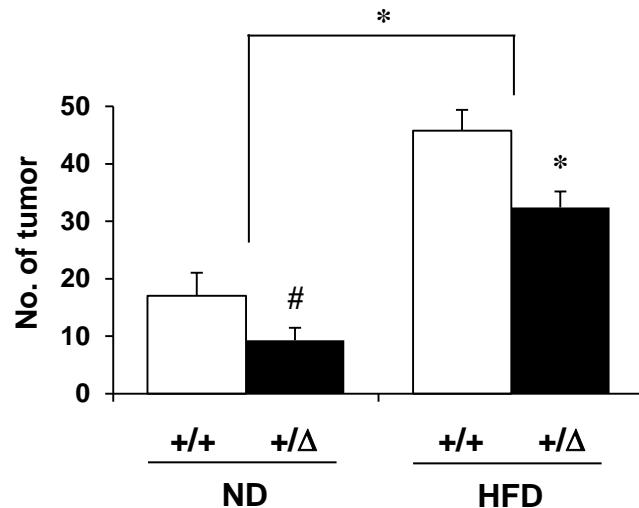

HFD for 30 weeks (36 week old mice)

(unpublished)

Reduced hepatocellular carcinoma in TonEBP haplo-deficiency: effects of high fat diet

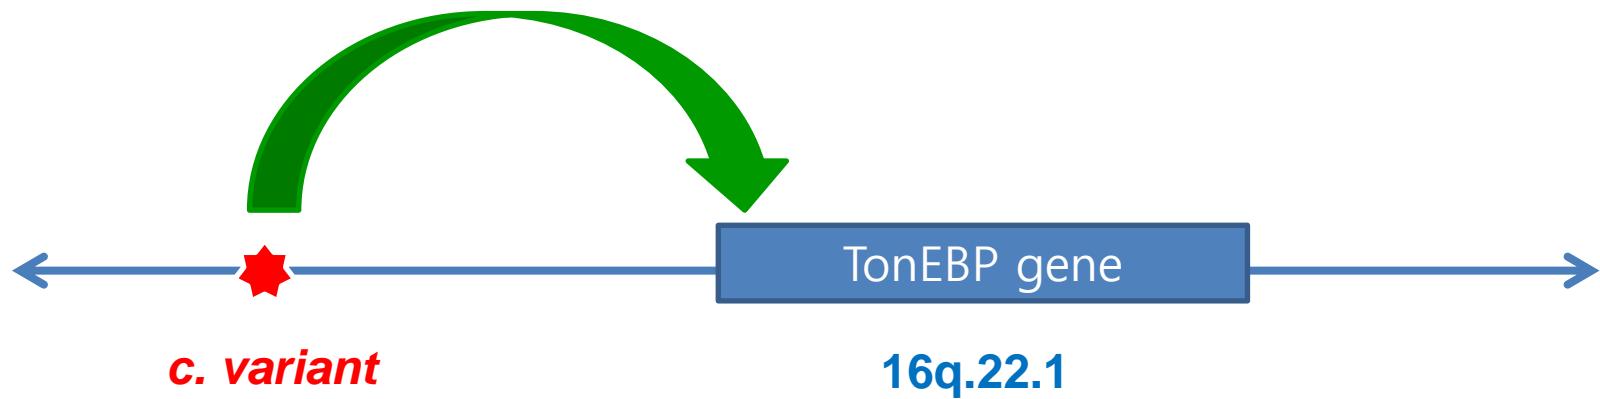

Max tumor (Di > 3 mm)

(unpublished)

Working Model:
Causative variant and phenotypes

TonEBP ↑ > NFκB ↑
atherosclerosis
rheumatoid arthritis
hepatocellular carcinoma
diabetic nephropathy

Diabetic nephropathy

- Leading cause of life-threatening ESRD (end-stage renal disease): ~55%
- In 2007 in US, 24 million have diabetes > 180,000 ESRD caused by diabetic nephropathy (22,000 in Korea)
- Develops over the course of > 20 years after onset of DM
- 1/3 of DM patients develop diabetic nephropathy: strong genetic component (family history)
- No therapy
- No risk assessment

Elevated Activity of Transcription Factor Nuclear Factor of Activated T-Cells 5 (NFAT5) and Diabetic Nephropathy

Type 1 diabetes

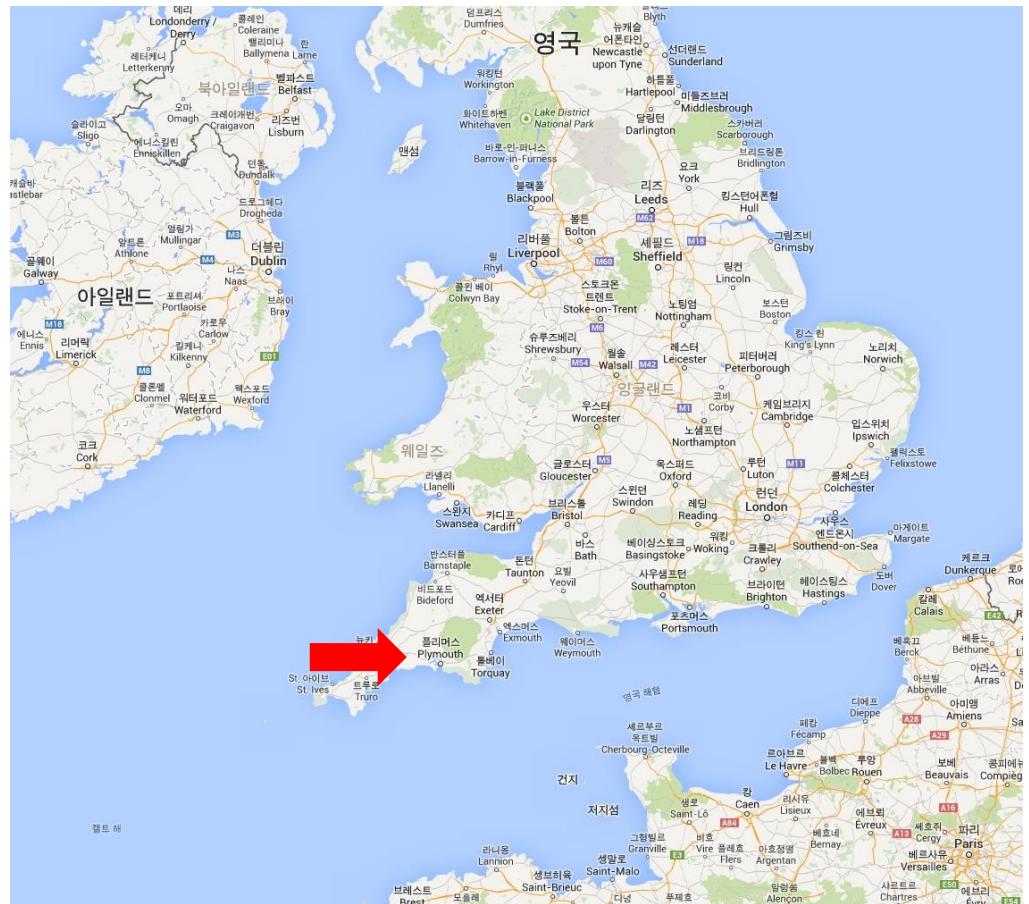

TABLE 1

Clinical characteristics of patients with type 1 diabetes and normal control subjects

	Diabetic nephropathic subjects	Diabetic control subjects	Normal control subjects
<i>n</i>	26	18	13
Age (years)	40.2 ± 2.5 (21–69)	44.2 ± 3.6 (26–65)	36.4 ± 3.5 (26–55)
Age at onset of diabetes (years)	13.6 ± 1.4 (6–27)	16.1 ± 2.8 (1–38)	—
Duration of diabetes (years)	28.0 ± 2.3 (8–47)	29.1 ± 2.4 (20–49)	—
Fasting glucose (mmol/l)	11.5 ± 1.4	9.7 ± 1.1	—
HbA _{1c} (%)	8.8 ± 0.3	8.4 ± 0.2	—
Male:female	8:18	5:13	6:7

Data are means ± SE (ranges).

Nephropathy:

three consecutive protein excretion >0.5 gm/day over 12 months

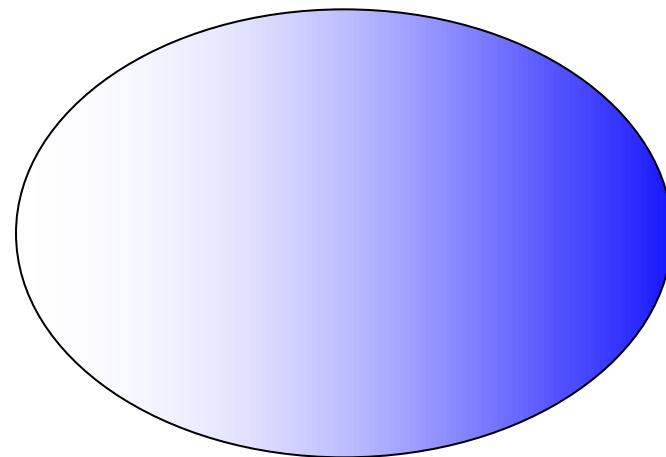

TABLE 2
DNA binding activities of NFAT5 to OREs in PBMCs and HMCs under high-glucose conditions

Probes	Diabetic nephropathic subjects	Diabetic control subjects	Normal control subjects	HMCs
<i>n</i>	26	18	13	10
OREA	1.50 ± 0.14	1.18 ± 0.09	1.40 ± 0.13	1.38 + 0.22
OREB	2.06 ± 0.27*	1.33 ± 0.18	1.11 ± 0.11	1.84 + 044†
OREC	1.94 ± 0.21‡	1.39 ± 0.11	0.95 ± 0.05	2.38 + 1.15§

Background

J Am Soc Nephrol 19: 789–797, 2008.

Association of Urinary Inflammatory Markers and Renal Decline in Microalbuminuric Type 1 Diabetics

Pawel P. Wolkow,^{*†} Monika A. Niewczas,^{*‡} Bruce Perkins,^{*§} Linda H. Ficociello,^{*} Boguslaw Lipinski,^{*} James H. Warram,^{*} and Andrzej S. Krolewski^{*}

- ✓ 5 inflammatory markers for renal function decline
 - IL-6, IL-8, MCP-1, IP-10, MIP-1 δ

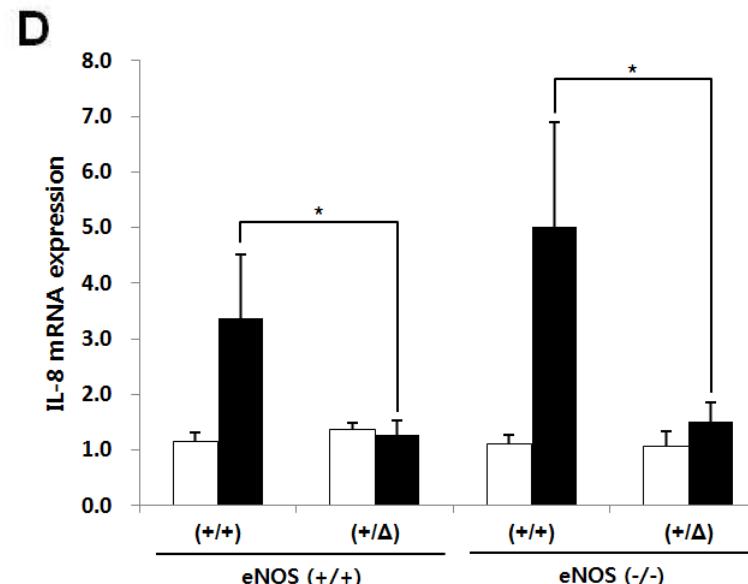

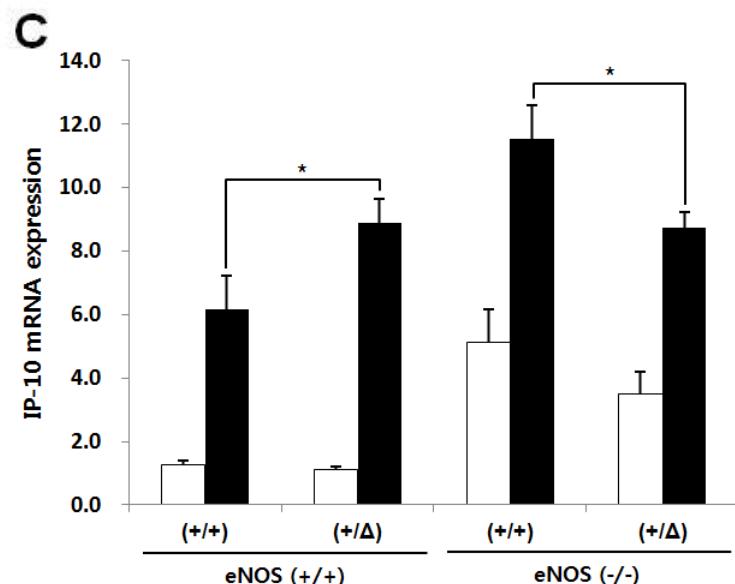

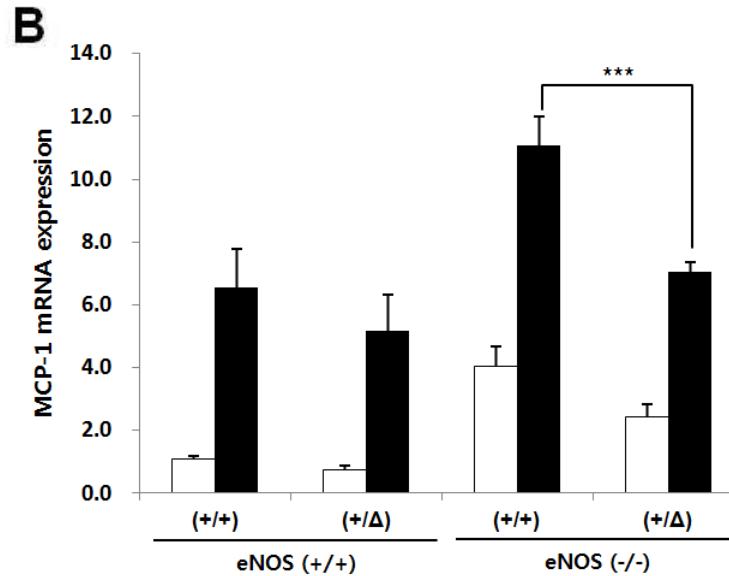

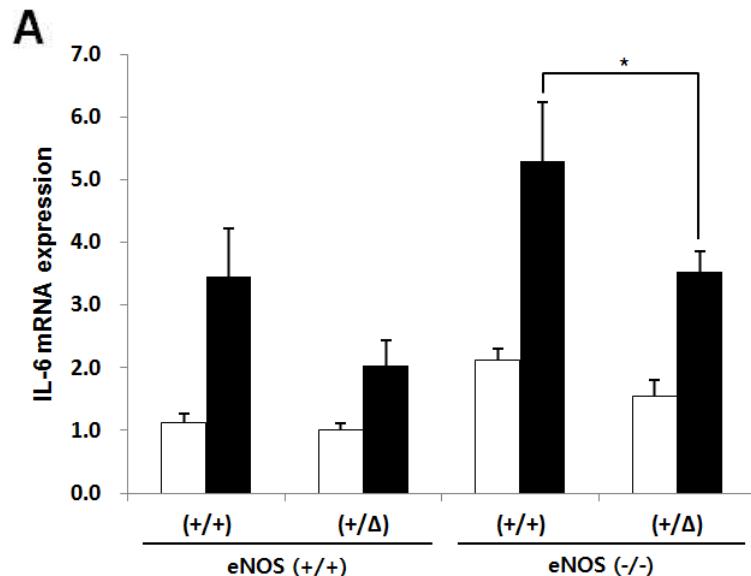

Table 3. Urinary concentrations of chemokines and cytokines according to study group^a

Markers	Individuals with Normoalbuminuria, Reference Group (n = 74)	Individuals with Microalbuminuria		P ^b
		Nondecliners (n = 43)	Decliners (n = 28)	
Measured concentrations (pg/ml)				
IL-6	0.7 (0.4, 1.4)	0.5 (0.4, 1.2)	1.2 (0.4, 12.0)	0.0304
IL-8	0.9 (0.2, 7.3)	0.8 (0.1, 3.9)	13.0 (2.7, 87.0)	0.0001
IP-10	4.9 (2.0, 48.0)	4.6 (2.2, 37.0)	47.0 (6.8, 217.0)	0.0009
MCP-1	39.0 (18.0, 70.0)	51.0 (18.0, 78.0)	76.0 (53.0, 168.0)	0.0029
MIP-1 δ	42.0 (12.0, 65.0)	38.0 (13.0, 71.0)	64.0 (47.0, 122.0)	0.0014
Concentrations adjusted for urinary creatinine (pg/mg creatinine)				
IL-6	0.9 (0.3, 2.0)	1.1 (0.4, 1.8)	1.6 (0.6, 15.0)	0.0780
IL-8	1.0 (0.3, 4.9)	0.8 (0.1, 3.9)	15.0 (3.1, 79.0)	0.0001
IP-10	5.1 (3.1, 60.0)	5.3 (2.6, 66.0)	49.0 (6.9, 228.0)	0.0021
MCP-1	49.0 (25.0, 90.0)	59.0 (32.0, 89.0)	95.0 (55.0, 198.0)	0.0054
MIP-1 δ	50.0 (16.0, 97.0)	48.0 (10.0, 91.0)	80.0 (48.0, 155.0)	0.0215

^aData are median (25th, 75th percentiles).

^bKruskal-Wallis test of the null hypothesis that all three groups are from the same distribution.
