🗉

High hospital readmission rates of patients with AHF

Initial insult

(e.g. infections, non-compliance with diet or medications, hypertension, ischemia, arrhythmia)

Fluid retention
Venous congestion

Mechanisms:

- Endothelial
- Neurohormonal
- Renal
- Cardiac

Fluid retention
Venous congestion
(Progressive over weeks)

ADHF

So, we should pay more attention to heart failure
' **PREVENTION** and to its TREATMENT, to optimize the
treatment conditions, not only for the doctor but also for the
patient [2].

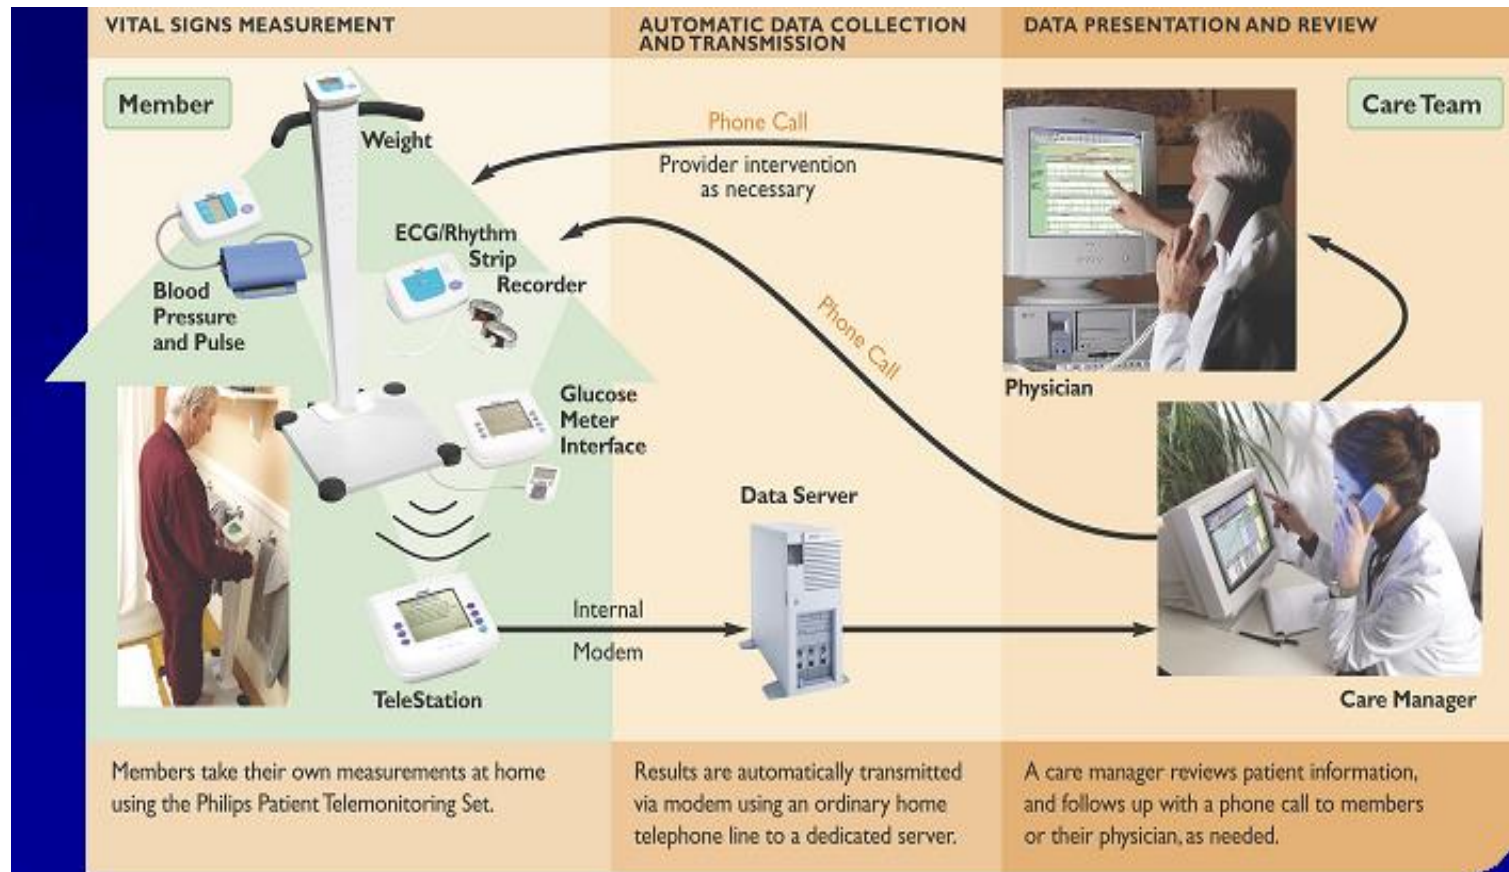

Not wasting time with stable patients, without
complications, so that the doctors can pay more
attention to more urgent and serious patients [2]

Better quality of life [2]

TEN-HMS

The Trans-European Network–Home-Care Management System
Patients about to be discharged from hospital after an exacerbation of chronic heart failure

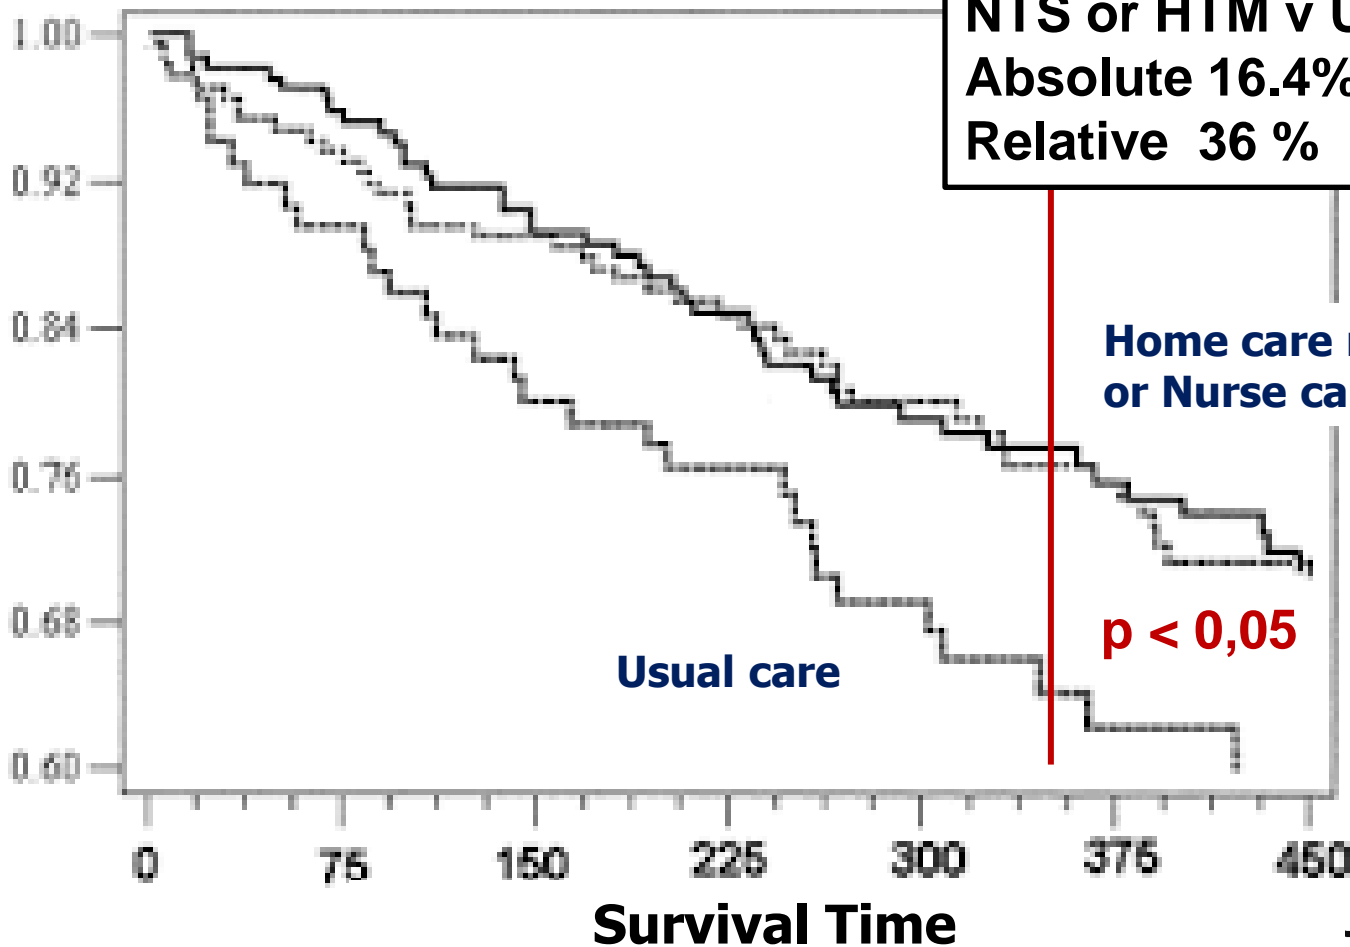

54% of Patients Aged >70 years

JACC 2005

Outpatient monitoring for early detection of ADHF is better

Survival distribution function

The concept of outpatient monitoring for early detection and treatment of ADHF is not new.

which parameters to monitor

&

what specific detection strategies

Heart failure require **IECD** [4]

This way, doctors could follow patients more carefully [4]

- Pacemakers
- ICDs (implantable cardioverter defibrillators)
- CRTs (cardiac resynchronization devices)
- Loop recorders
- Implantable hemodynamic monitors

IECD have the ability to [4]:

1. restore normal cardiac activation sequence
2. detect and treat a malignant arrhythmia, by means of electrical therapy
3. maintain rhythm
4. provide cardiac resynchronization therapy
5. prevent sudden cardiac death

References

[4] Costa PD, Rodrigues PP, Reis AH, Costa-Pereira A. 2010.

Since the 70s

REMOTE MONITORING

- Has been used in the follow-up of patients with IECD in alternative to monitoring on a presential consultation [4, 5, 7, 8]

- It consists on the use of electronic information and communication technologies to provide health care at distance and allow remote decisions, in order of maintaining or improving patient s' health [8]

The rapidly expanding role of
cardiac implantable electronic devices (CIEDs)
in HF patients presents an opportunity
to broaden the paradigm of
outpatient **HF monitoring**

Sensor modalities for Heart Failure Monitoring

Sensors	Examples
Currently available sensors	
Heart rate derivatives	Mean heart rate, nocturnal heart rate Heart rate variability (SDAAM, SDANN) HRV foot print
Accelerometers	Physical activity level
Impedance monitors	RV-CAN LV-RV, LV-can impedance Minute ventilation
Hemodynamic	Right ventricular pressure RV dP/dTmax (ePAD) Left atrial pressure (heart POD) Pulmonary artery pressure (Champion)
Cardiac output	Doppler RV O2 saturation monitor
Heart sounds	Peak endocardial acceleration

Reduced short-term HRV during controlled breathing is a powerful predictor of sudden death in patients with CHF

HRV can be measured from CIEDs with atrial leads by determining the standard deviation of 5-minute median atrial-atrial intervals (SDAAM) or consecutive ventricular (N-N) intervals (SDANN) over a 24-hour period. Periods of atrial pacing or high atrial rate episodes, including atrial fibrillation, are excluded from HRV analysis

Prognostic utility of a risk score based on 4 simple sensor-derived parameters (SDANN, HRV footprint, HR, and physical activity)

Significant improvement in HF hospitalization associated with chronic RVP monitoring (Chronicle IHM) compared with standard HF therapy

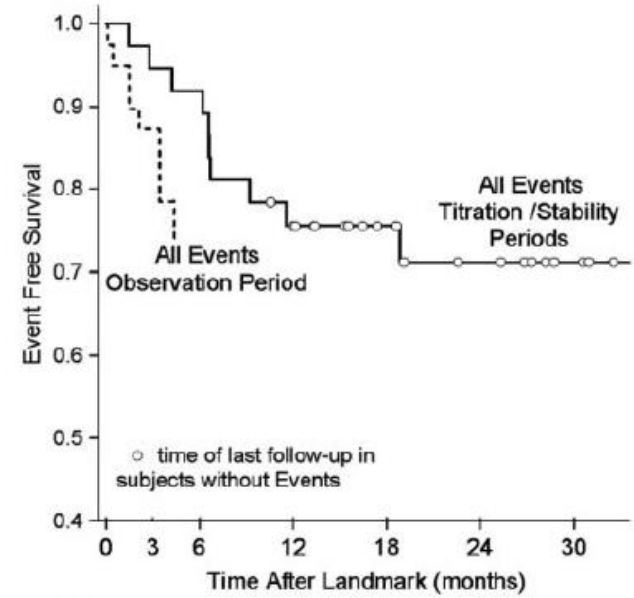

Number at Risk

	0	50	100	150	200
CHRONICLE	124	120	108	101	93
CONTROL	132	119	110	91	87

A commercially available implantable pressure sensor (Chronicle IHM, Medtronic Inc, Minneapolis, Minn)

Left atrial pressure monitoring compared with the observational period of standard HF care

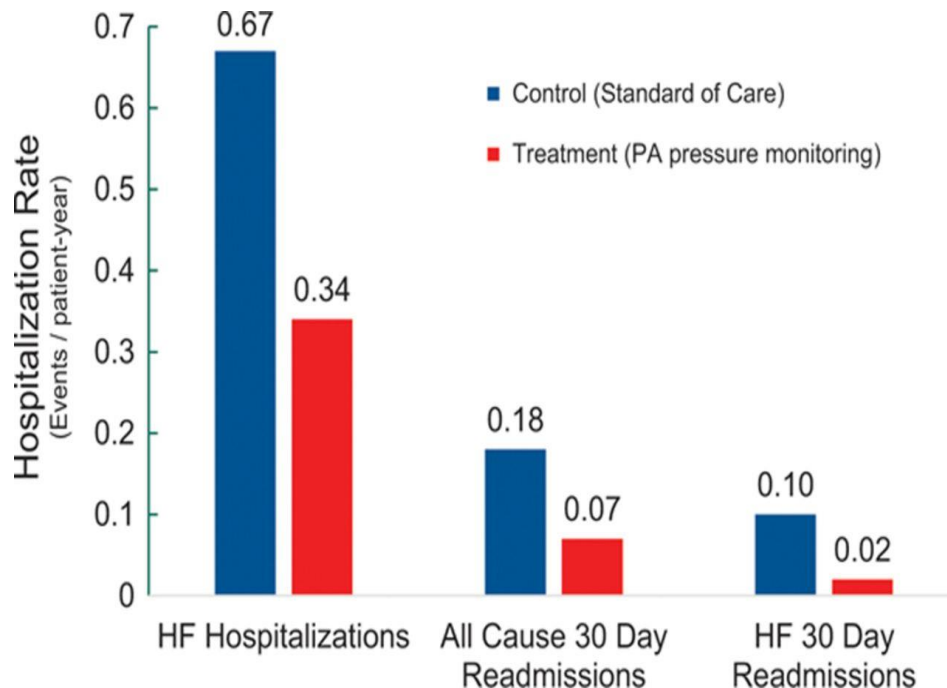

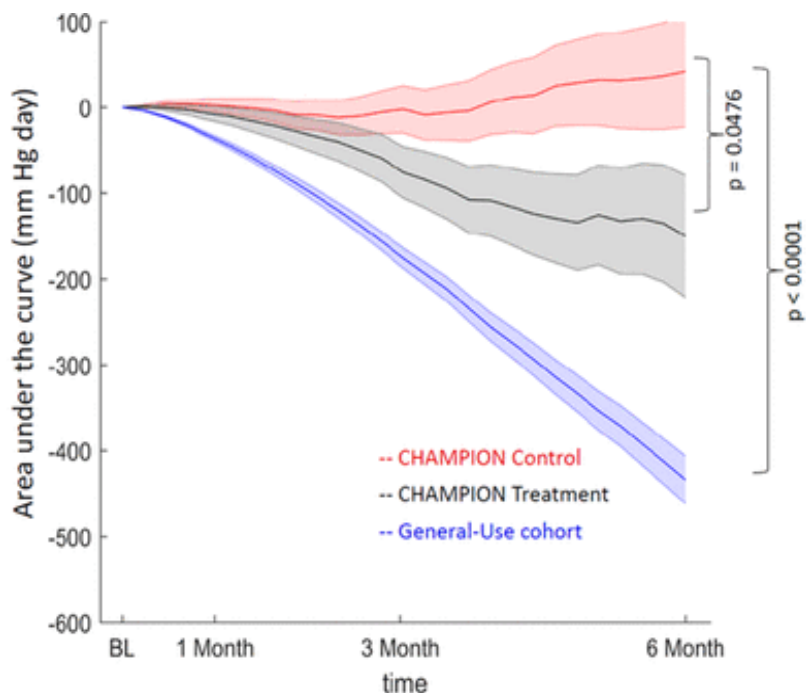

Numbers at risk:

Observation:	35	0				
Titration /Stability:	37	35	28	18	13	7

The HeartPOD (St Jude Medical Inc, Minneapolis, Minn) is a permanently implantable LAP sensor inserted during transseptal cardiac catheterization

PAP-guided management demonstrated a significant 30% relative risk reduction in HF hospitalization at 6 months

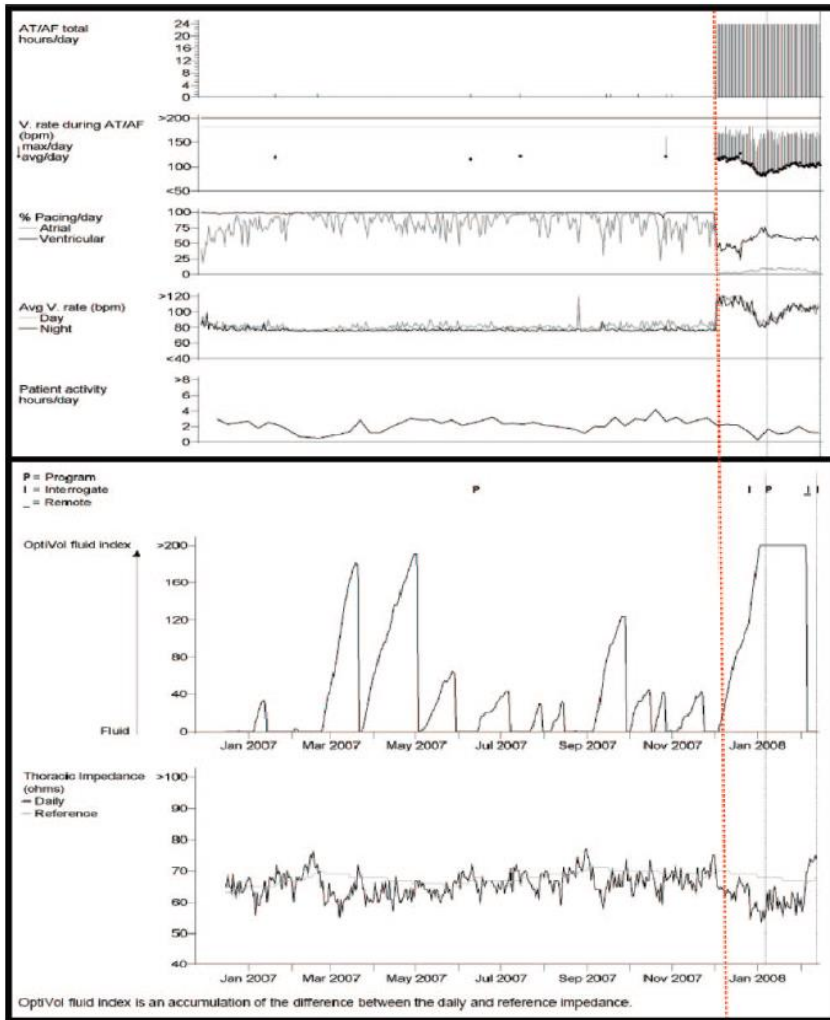

Champion, CardioMEMS, Atlanta, Ga

		1 Month	3 Month	6 Month
CHAMPION Control	(275pts)	3.1 ± 6.7 (270pts)	-5.5 ± 24.7 (251pts)	42.0 ± 65.0 (228pts)
CHAMPION Treatment	(270pts)	-7.0 ± 7.7 (266pts)	-59.3 ± 27.6 (257pts)	-150.1 ± 71.0 (236pts)
General-Use cohort	(2000pts)	-32.8 ± 2.9 (1920pts)	-156.2 ± 10.6 (1816pts)	-434.0 ± 27.5 (1655pts)

2011 Lancet

Impedance Monitoring

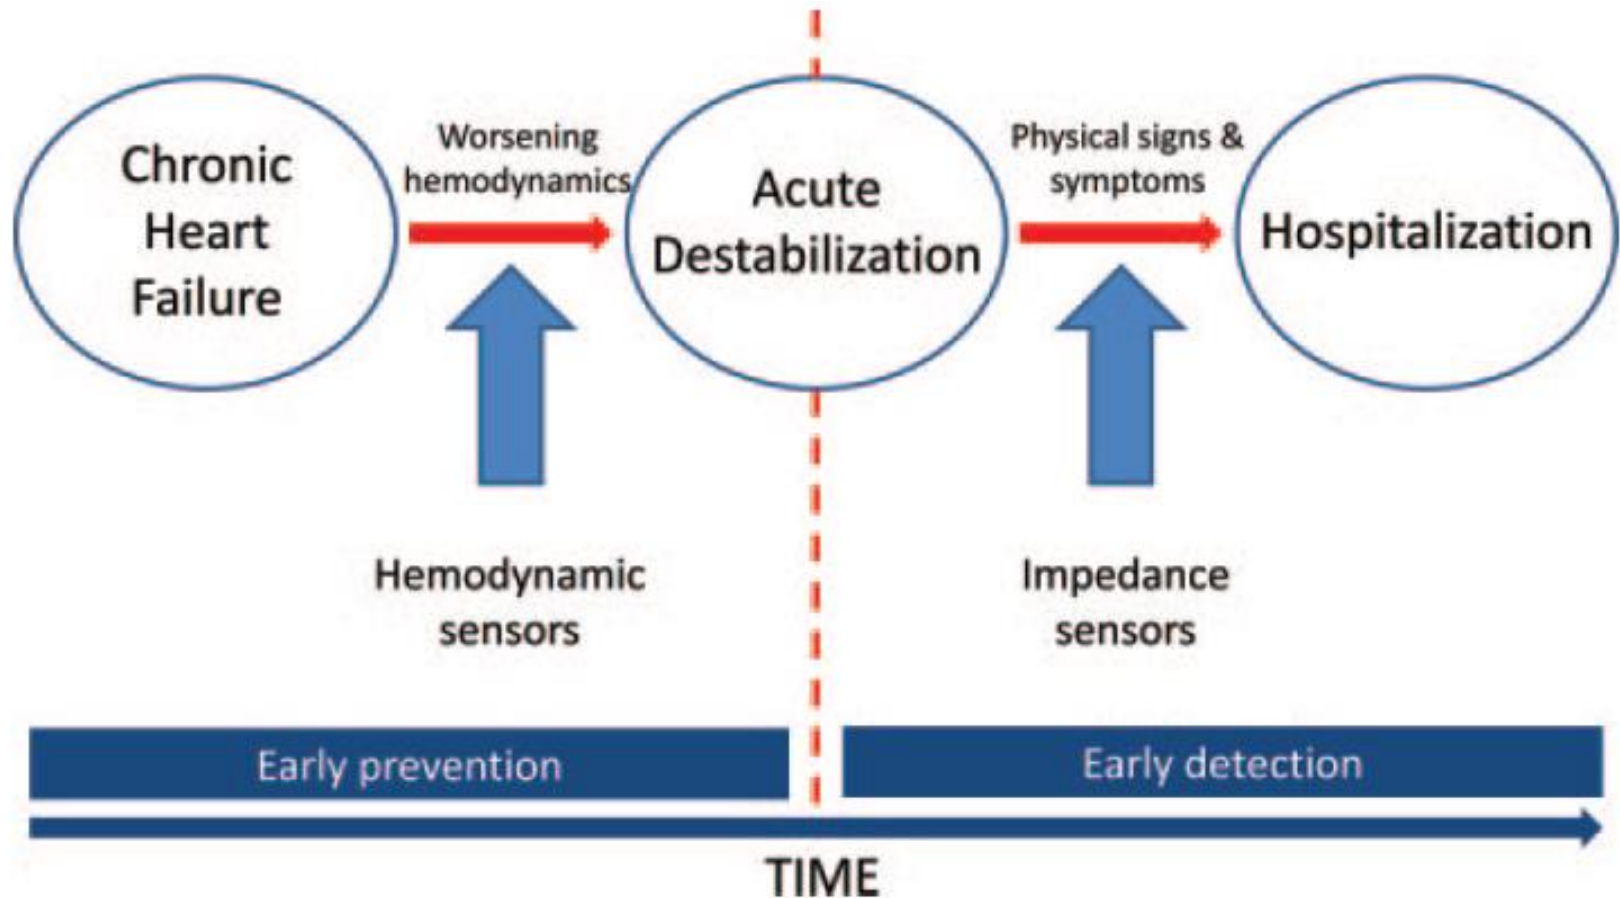

A drop in the electric impedance (ohms) across the thoracic cavity reflects an increase in tissue fluid content in the interpositioned pulmonary tissue and signals a state of volume overload and fluid retention.

False positive and negative .

Mild signs or symptoms of congestive HF and may trigger changes in treatment but do not necessarily lead to hospitalization for ADHF

Theoretical paradigm for a multiple sensor strategy

Opportunities for Future Sensor Development

- Chemicals PO₂, PCO₂, pH
- Electrolytes, glucose
- Biomarkers Natriuretic peptides (BNP, NT-proBNP, ANP)
 - Inflammatory markers (TNF- α , IL-6, hsCRP)
 - Troponin
- Metabolomic/signaling cascades
 - Apoptosis/caspase signaling
 - Glycolysis
- Microtubule assembly pathways

Summary

- The concept of outpatient monitoring for early detection and treatment of ADHF is very important.
- The greatest potential for CIEDs in HF management lies in the ability to directly couple both sensor and effector functions within the device
- The expanding role of implantable sensors is leading to a paradigm shift in HF management.
- Implantable sensors will become part of routine clinical care, and, when coupled with remote monitoring, will allow the practice of a more personalized form of medicine and enable early, automated therapeutic interventions and improve clinical outcomes.
