Celecoxib, a Cyclooxygenase-2 Inhibitor, Reduces Neointimal Hyperplasia Through Inhibition of Akt Signaling

Han-Mo Yang, MD; Hyo-Soo Kim, MD; Kyung-Woo Park, MD; Hyun-Jeong You, BA; Soo-In Jeon, BA; Seock-Won Youn, MS; Sung-Hwan Kim, MD; Byung-Hee Oh, MD; Myoung-Mook Lee, MD; Young-Bae Park, MD; Kenneth Walsh, PhD

Background—Celecoxib has been shown to have antitumor effects that may be mediated through the cyclooxygenase-independent inhibition of Akt signaling. Here, we examined the effects of celecoxib on neointimal formation after balloon injury and its mechanism of action.

Methods and Results—In vitro experiments were performed to evaluate the effects of celecoxib on the Akt/GSK signaling axis and the viability of rat vascular smooth muscle cells (VSMCs). In vivo experiments examined the effects of celecoxib, aspirin, and vehicle on neointimal growth after denudation injury to rat carotid arteries. In vitro, celecoxib suppressed the phosphorylation of Akt and GSK in cultured VSMCs, leading to a reduction in viable cell number, which was reversed by transduction of constitutively active Akt. Such a reduction in cell number was mediated by inhibition of proliferation and induction of apoptosis. In vivo, celecoxib reduced injury-induced phosphorylation of Akt and GSK, reduced VSMC proliferation, and increased caspase-3 activation and VSMC apoptosis at 3 days after injury, whereas aspirin had no effect. At 2 weeks after injury, celecoxib reduced intima-to-media ratio, whereas aspirin had no effect. Adenovirus-mediated delivery of dominant negative Akt was as effective as celecoxib at inhibiting neointimal formation. Conversely, gene delivery of constitutively active Akt significantly reversed the inhibition of intimal hyperplasia by celecoxib, providing causal evidence that the modulation of Akt signaling by celecoxib is a physiologically relevant mechanism.

Conclusions—Celecoxib is a potential inhibitor of neointimal formation by blocking injury-induced Akt activation. These findings suggest a potential use for celecoxib in the prevention of restenosis after angioplasty. (***Circulation***. **2004;110: 301-308.)**

COREA-TAXUS Trial in Lancet 2007

Effect of celecoxib on restenosis after coronary angioplasty with a Taxus stent (COREA-TAXUS trial): an open-label randomised controlled study

Bon-Kwon Koo, Yong-Seok Kim, Kyung-Woo Park, Han-Mo Yang, Dong-A Kwon, Jin-Wook Chung, Joo-Yong Hahn, Hae-Young Lee, Jin-Shik Park, Hyun-Jae Kang, Young-Seok Cho, Tae-Jin Youn, Woo-Young Chung, In-Ho Chae, Dong-Ju Choi, Byung-Hee Oh, Young-Bae Park, Hyo-Soo Kim

Summary

Background In-vitro and animal experiments have shown that the cyclo-oxygenase 2 inhibitor celecoxib can reduce formation of neointima within stents. We aimed to test whether celecoxib has similar effects in a clinical setting.

Methods In a randomised two-centre trial, we enrolled 274 patients who had angina pectoris or a positive stress test and who had native coronary artery lesions for which implantation of paclitaxel-eluting stents was feasible. All patients were given aspirin (100 mg daily) and clopidogrel (75 mg daily). 136 patients were randomly assigned to receive celecoxib (400 mg before the intervention, and 200 mg twice daily for 6 months after the procedure). The primary endpoint was late luminal loss on quantitative coronary angiography at 6 months after the intervention. Secondary endpoints were cardiac death, non-fatal myocardial infarction, and revascularisation of the target lesion. Analysis was done on a modified intention-to-treat basis. This study is registered with ClinicalTrials.gov, number NCT00292721.

Findings At 6 months, mean in-stent late luminal loss was lower in the celecoxib group (0·49 mm, SD 0·47) than in the control group (0·75 mm, 0·60) (absolute difference 0·26 mm; 95% CI 0·12–0·40). Frequency of secondary outcomes at 6 months was also lower in the celecoxib group, mainly because of a reduced need for revascularisation of the target lesion.

Interpretation These data suggest that the adjunctive use of celecoxib for 6 months after stent implantation in patients with coronary artery disease is safe and can reduce the need for revascularisation of the target lesion.

Lancet 2007; 370: 567–74

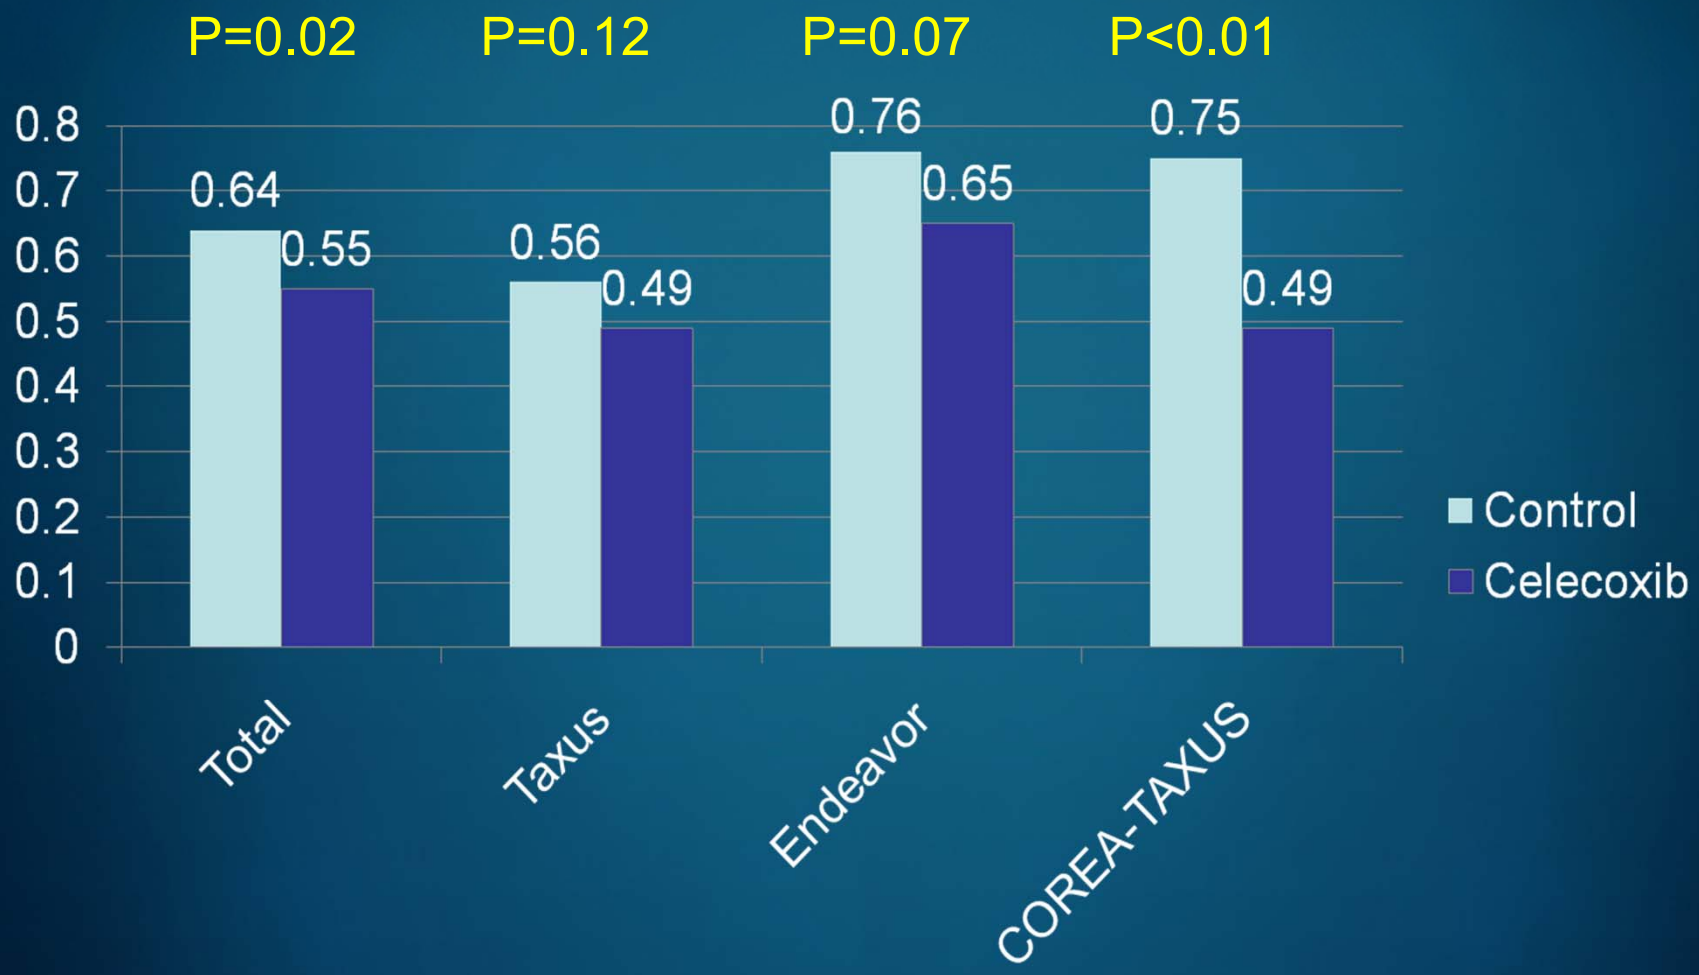
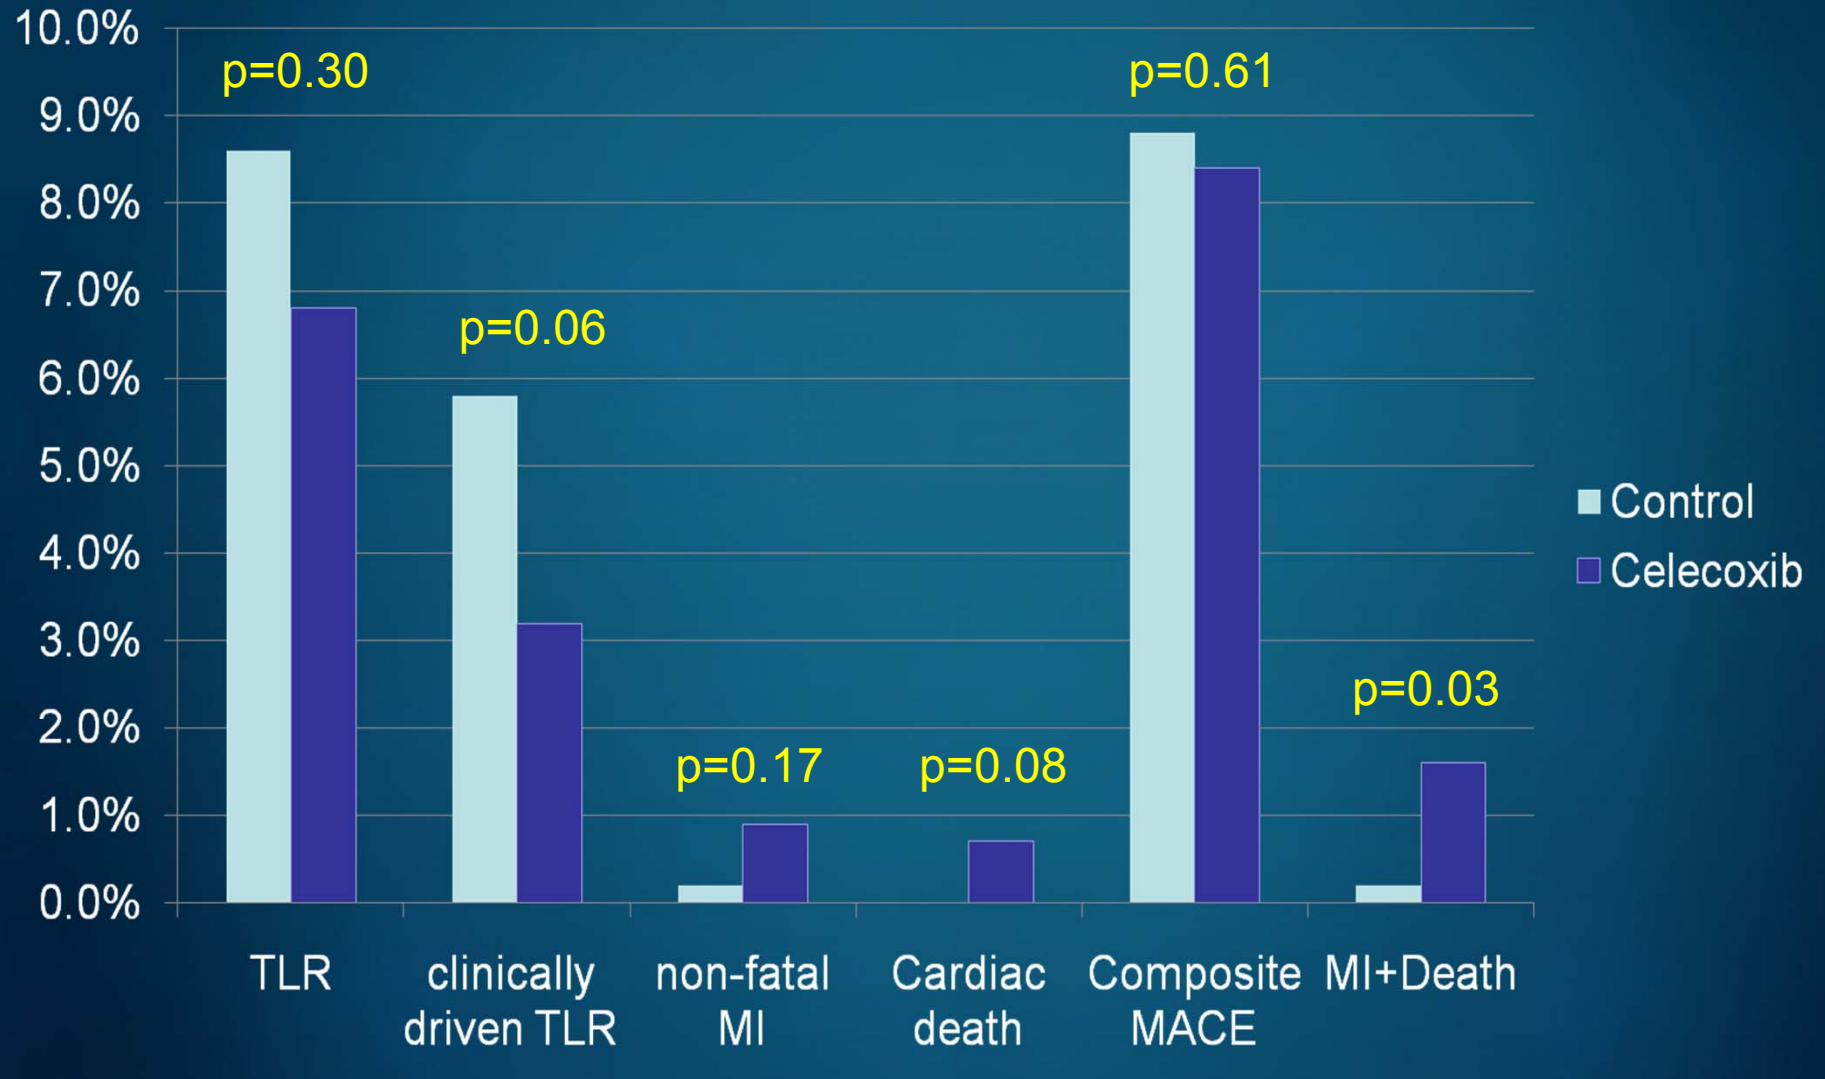
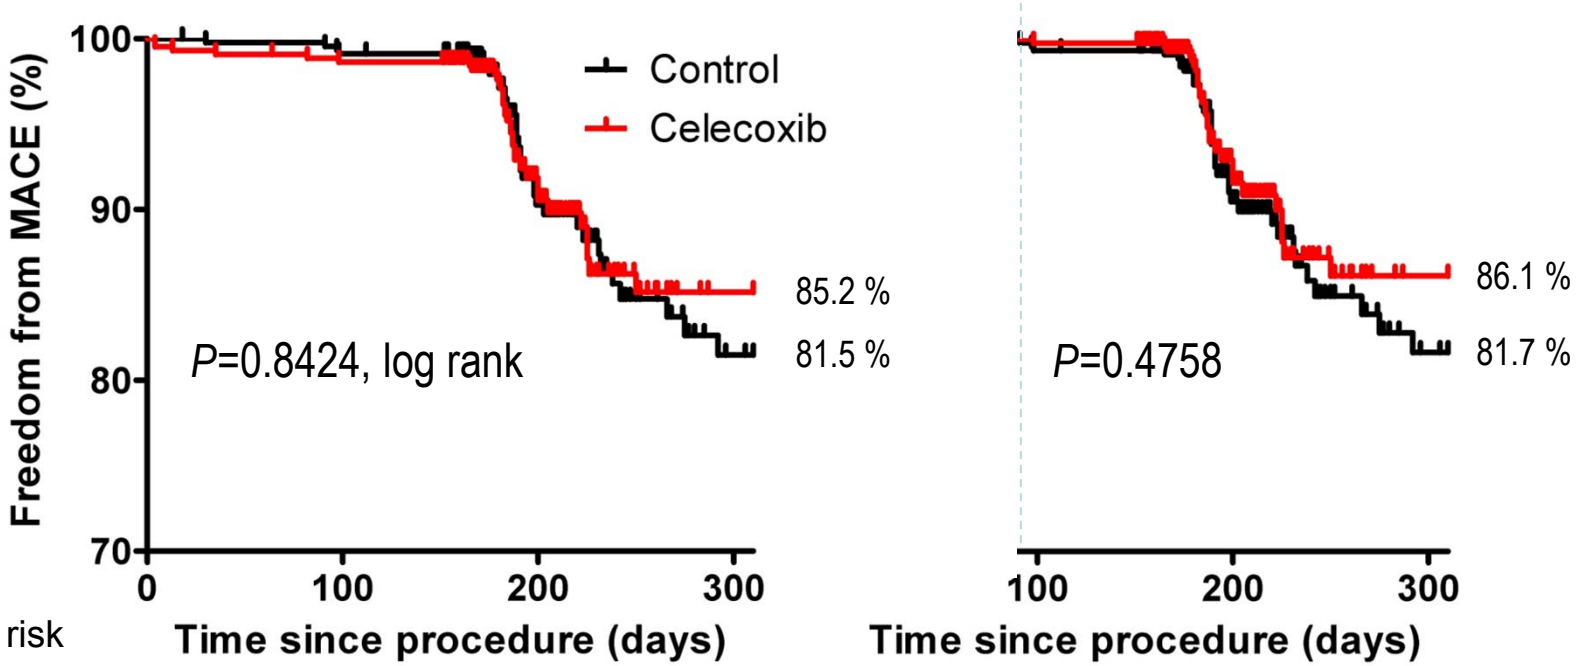
Primary endpoint: In-stent late luminal loss at 6 month



Clinical outcomes at 6 months follow-up



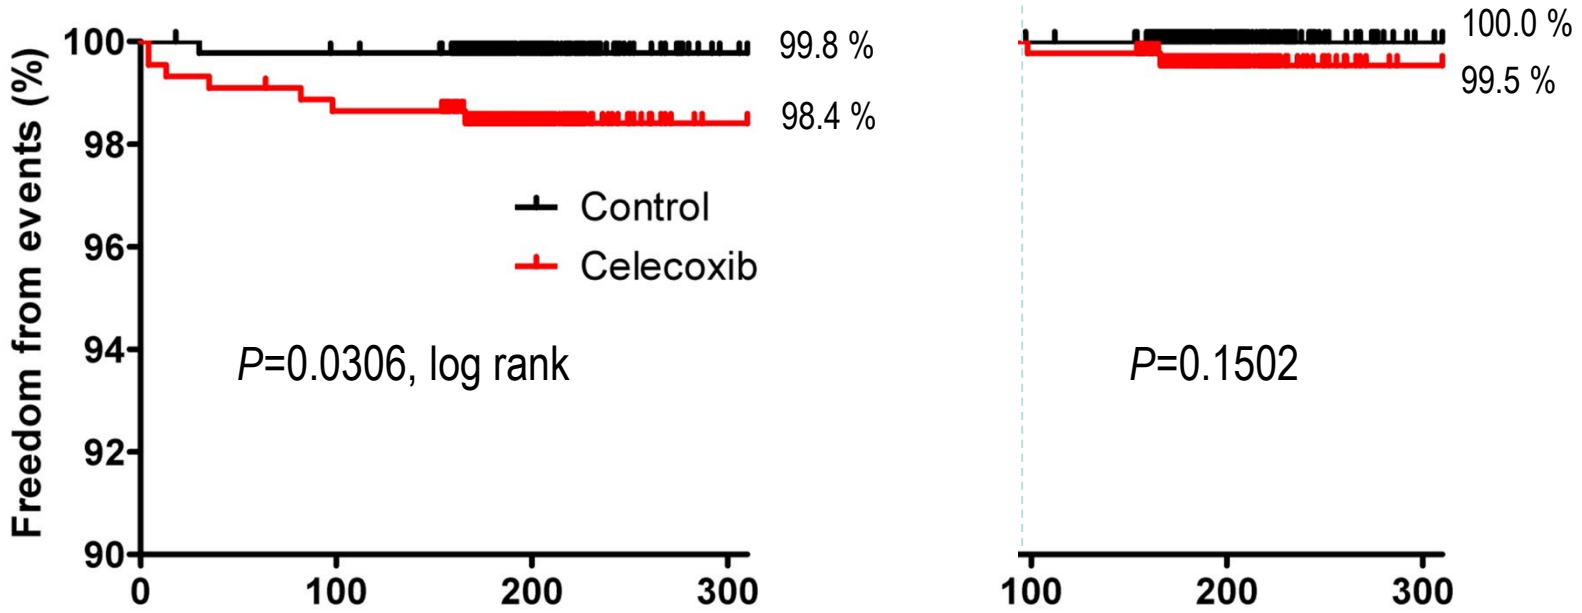
Freedom from MACE: Landmark analysis



Number at risk				
Celecoxib	442	435	141	69
Control	454	449	167	70

435	141	69
449	167	70

Freedom from hard end points : Land mark analysis



Number at risk				
Celecoxib	442	435	138	72
Control	454	451	170	73

435	138	72
451	170	73

Cilostazol's effect on hard end points

Dual antiplatelet therapy

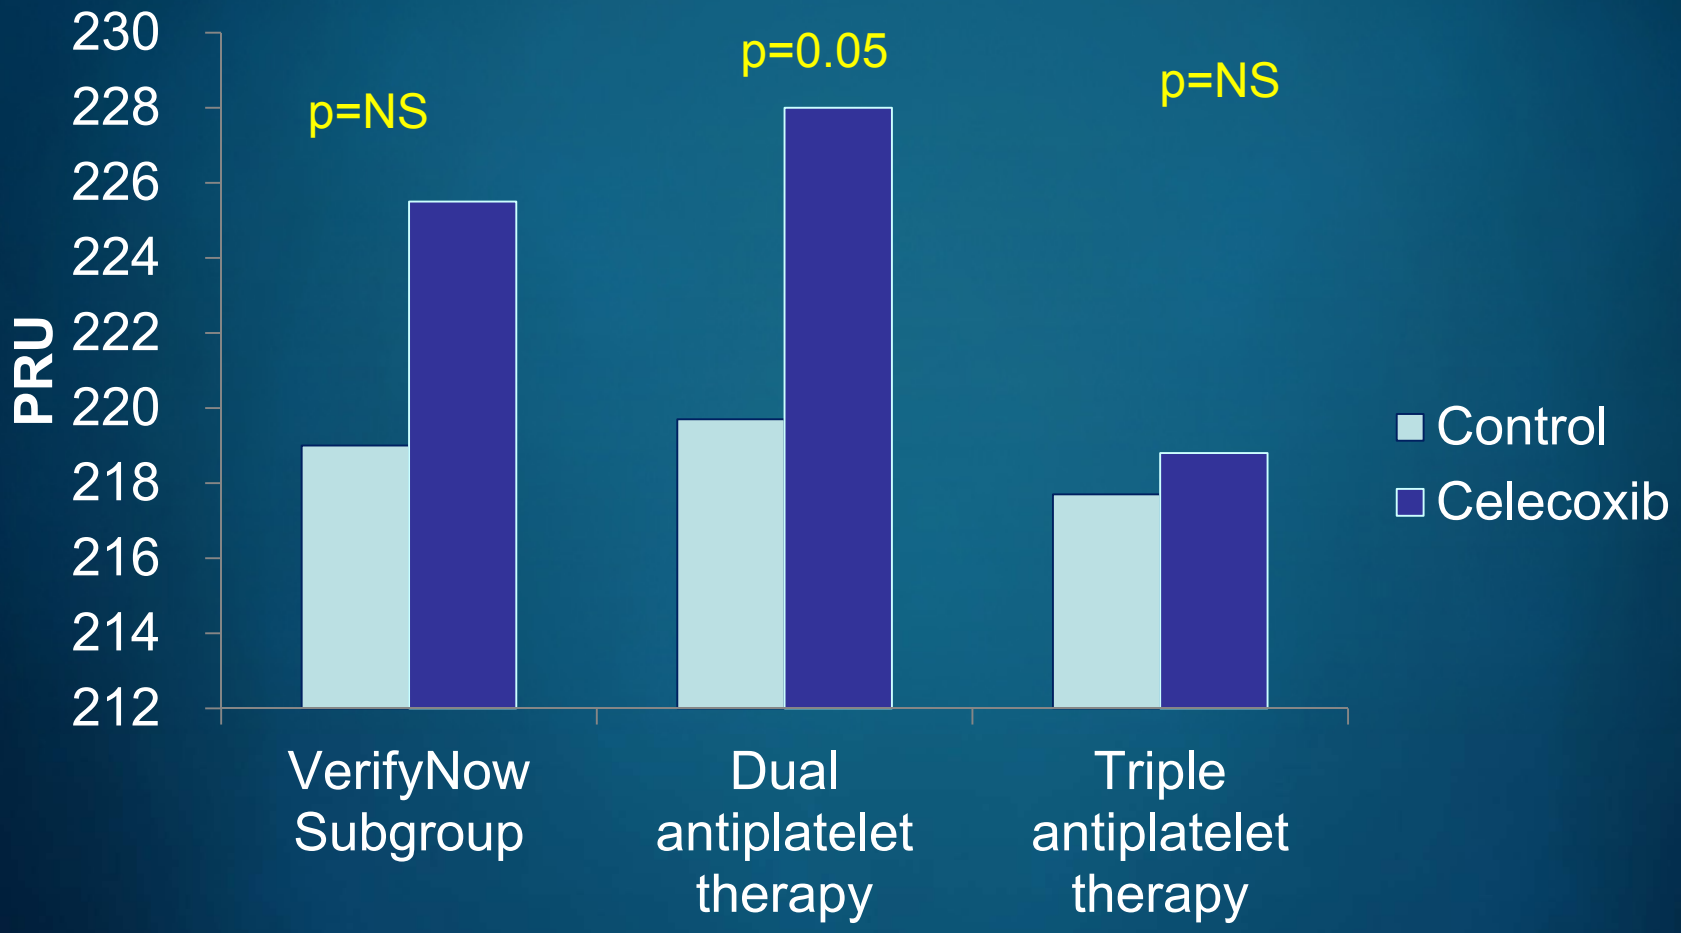
	Control (N=318)	Celecoxib (N=318)	p-value
Late loss (mm) N=281/286	**0.65 (0.54)**	**0.58 (0.49)**	**0.079**
TLR (%)	28 (8.8)	21 (6.6)	0.298
Clinically driven TLR (%)	20 (6.3)	12 (3.8)	0.147
Non-fatal MI (%)	0 (0.0)	3 (0.9)	0.083
Cardiac death (%)	0 (0)	3 (0.9)	0.083
Total (%)	28 (8.8)	25 (7.9)	0.667
Composite of CD, MI	**0 (0.0)**	**6 (1.9)**	**0.014**

Triple antiplatelet therapy

	Control (N=134)	Celecoxib (N=123)	p-value
Late loss (mm) N=119/104	**0.60 (0.56)**	**0.49 (0.42)**	**0.086**
TLR (%)	11 (8.2)	9 (7.3)	0.789
Clinically driven TLR (%)	6 (4.5)	2 (1.6)	0.189
Non-fatal MI (%)	1 (0.8)	1 (0.8)	0.952
Cardiac death (%)	0 (0.0)	0 (0.0)	-
Total (%)	11 (8.2)	9 (7.3)	0.789
Composite of CD, MI	**1 (0.8)**	**1 (0.8)**	**0.951**

VerifyNow Subgroup

587 among 996 patients were analyzed with VerifyNow.



mini-COREA-TAXUS trial

Message

- Adjunctive use of Akt/COX2 inhibitor (celecoxib)

– Positive aspect

: reduced late loss & TLR after DES

– Negative aspect

: increased thrombotic events d/t inhibition of DAT

: can be overcome by TAT

History of SNUH Akt/COX2 inhibitor Program
Communication between bench and bed side

1. Initiation point of Akt & Celecoxib at bench
2. Cautious Consideration between bench & bed-side
3. First clinical trial (COREA-TAXUS): bench to bed-side
4. Return to bench : further complicated story

   : Taxol → COX2 → MDR-1 → Neointima
5. Feasibility confirmation between bench & bed-side

   : genotype of MDR-1 in patients with DES
6. Second clinical trial (mini-COREA) : bench to bed-side

‘Misfortune’ in Translational Cardiology from Akt/COX2 to mini-COREA RCT

- Good luck is as important as good result.
- Impact of innovative results from translational research may be determined by the advance of the associated field.
- (Excellent new generation DESs nullify the necessity of new drug development.)

‘Hope’ in Translational Cardiology from Akt/COX2 to mini-COREA RCT

- New drugs with combined effects of (celecoxib + cilostazol) may be helpful for a specific subgroup having great late loss even after newest DES.

- For highest risk subpopulation : Multiple bifurcation stenting in patients with DM / CRF / Strong genetic background of atherosclerosis

Translational Cardiology: Where are we now?

One example of research ‘from bench to bedside’

(from Akt to Mini-COREA clinical trial)
