MHT

- > The health care system faces daunting challenges.
 - With the improvements in health care in the last few decades, residents of industrialized countries are now living longer, but with multiple, often complex, health conditions
 - Survival from acute trauma has also improved, but this is associated with an increase in the number of individuals with severe disabilities

Fundamental questions

- How do we care for an increasing number of individuals with complex medical conditions?
- How do we provide quality care to those in areas with reduced access to providers?

Key enabling technologies for Health monitoring systems

- Wearable systems for patients' remote monitoring
- The miniaturization of sensors and electronic circuits
 - The flexible circuit
 - MEMS technology

- Advances in material science
 e-textile
 - Health monitoring applications of wearable systems
 - MIThril system

Key enabling technologies for Health monitoring systems

- Mobile phone technology
 - Smart phones are broadly available.
 - Global smart phone market is growing at an **annual rate of 35**%
 - GPS tracking system
 - Cloud-based system

Key enabling technologies for Health monitoring systems

- Data analysis techniques such as signal processing, pattern recognition, data mining and other artificial intelligence-based methodologies have enabled remote monitoring applications that would have been otherwise impossible.
- Data analysis- Big data Mining

Sensing technology

- Information gathered using body-worn (i.e. wearable) sensors
- Wearable sensors are often combined with ambient sensors
 - Specifically-designed data analysis procedures would then be used to detect falls via processing of motion and vital sign data.

Wearable sensors

- Physiological measures of interest in rehabilitation
 - Integrating physiological monitoring in a wearable system often requires ingenious designs and novel sensor locations.
 - Ring sensor design for measuring blood oxygen saturation (SpO2) and heart rate

• Self-contained wearable cuff-less PPG based blood pressure monitor

Wearable sensors

- Physiological measures of interest in rehabilitation
 - Ear-worn, flexible, low-power PPG sensor

- BIOTEX project (European Commission)
 - An array of bio-chemical sensors

Ambient sensors

- Ambient Assisted Living (AAL)
 - Embedded
 - Personalized
 - Anticipatory

- Smart home projects
 - The Technology Research for Independent Living (TRIL) Center in Ireland
 - The TigerPlace in Missouri
 - The Oregon Center for Aging and Technology (ORCATECH) in Oregon
 - The University of Rochester Center for Future Health
 - The University of Florida Gator-Tech Smart House
 - The Georgia Institute of Technology Aware Home
 - The Massachusettes Institute of Technology PalceLab

Applications : Health and Wellness monitoring

- Activities of Daily Living (ADL)
 - In-shoe pressure and acceleration sensor system
 - To classify activities including sitting, standing, and walking with the ability of detecting whether subjects were simultaneously performing arm reaching movements.

(c)

Applications : Safety monitoring

- Safety monitoring applications, such as **detecting falls and relaying alarm** messages to a caregiver or an emergency response team
 - Commercially-available devices designed for safety monitoring 0
 - The Life Alert Classic by Life Alert Emergency Response Inc.

The Alert One medical alert system

Get the help you need fast.

1. Press Your 100% waterproof help button will get you help for any type of emergency, big or small, 24/7

2. Respond A US-based operator from one of our two Command Centers come on the line to assist you in seconds. Even if you cannot speak- we follow the procedures set up ahead of time to make sure you get help

3. Send Help

We stay on the line with you until help arrives so that you are never alone. We reduce worry by notifying your family members, neighbors or doctors

Call 1-888-981-9871 or order online today

Applications : Home rehabilitation

- Virtual Reality (VR) and Gaming for Home-Based Motor Assessment & Training
 - By the Rehabilitation Engineering Research Center at the University of Southern California
 - VR simulation technology has been applied to improve motor skills in subjects

- Stroke Rehabilitation Exerciser
 - By Philips Research
 - A wireless inertial sensor system records the patient's movements, analyzes the data for deviations from a personal movement target and provides feedback to the patient and the therapist

Applications : Assessment of treatment efficacy

- A quantitative way of assessing treatment efficacy can be a valuable tool for clinicians in disease management.
 - By knowing what happens between outpatient visits, treatment interventions can be fine-tuned to the needs of individual patients
 - The Disability Creation Process, conceptual scheme

Applications : Early detection of disorders

- An area of growing interest in the field of wearable technology is to achieve early detection of changes in patient's status requiring clinical intervention.
 - VTAMN project
 - Smart Cloth for Ambulatory Remote Monitoring of Physiological Parameters and Activity
 - Monitoring of patients with chronic obstructive pulmonary disease
 - Simultaneous monitoring of **activities** and several physiological parameters such as **heart rate**, **respiration** and **oxygen saturation** using wearable sensors and systems

MOLLUSCUM CONTAGIOSUM is a benign but contagious skin condition caused by a poxvirus. Skin-to-skin contact with a person with the virus can cause these small "bumps" known as papules to appear. These bumps are often shiny and have a small indentation in the middle. Molluscum lesions can clear spontaneously after several months. They can be treated by curettage (scraping them off) at a clinic or by a dermatologist.

DICOM

의료용 디지털 영상 및 통신 표준

 의료용 디지털 영상 및 통신(Digital Imaging and Communications in Medicine, DICOM) 표준은 의료용 기기에서 디지털 영상표현과 통신에 사용되는 여러 가지 표 준을 총칭하는 말로, <u>미국방사선의학회</u>(ACR)와 <u>미국전기공업회</u>(NEMA)에서 구성 한 연합 위원회에서 발표한다.

▶ 역사[<u>편집]</u>

 미국방사선의학회와 미국전기공업회는 의료 영상 장비의 표준화를 위해 1983년 ACR-NEMA 디지털 영상전송 표준 위원회를 발족하였다. 1985년 ACR-NEMA 표 준 버전 1.0(출판번호 300-1985)이 <u>북미방사선학회</u>(RSNA)에서 처음으로 발표되었 으며, 이어 1988년에는 버전 2.0(출판번호 300-1988)이 발표되었다. 이후 <u>객체지향</u> 정 보 모델을 사용하는 등 큰 수정이 가해지면서 새로운 명칭을 필요로 하게 되었고, 그 결과 1992년 <u>북미방사선학회</u> 회의에서 DICOM이라는 명칭의 표준이 처음으로 제 안되었다. DICOM은 1993년 첫 데모 버전이 발표된 이후 지금까지 꾸준히 수정되고 있다.

SNOMED

- History[edit]
 - <u>SNOMED</u> was started in 1965 as a Systematized Nomenclature of Pathology (SNOP) and was further developed into a logic-based health care terminology.^{[6][7]}
 - SNOMED CT was created in 1999 by the merger, expansion and restructuring of two large-scale terminologies: SNOMED Reference Terminology (SNOMED RT), developed by the <u>College of American Pathologists</u> (CAP); and the Clinical Terms Version 3 (CTV3) (formerly known as the <u>Read codes</u>), developed by the<u>National <u>Health Service</u> of the United Kingdom (NHS).^{[8][9]} The final product was released in January 2002.

Cardiac Rehabilation

Who?

Conclusion

- Whereas the first decade of research in the field of wearable technology was marked by an emphasis on the engineering work needed to develop wearable sensors and systems, recent studies have been focused on the application of such technology toward monitoring health and wellness.
- Consequently, we have witnessed a great deal of work toward the integration of wearable technologies and communication as well as data analysis technologies so that the goal of remote monitoring individuals in the home and community settings could be achieved. Besides, when monitoring has been performed in the home, researchers and clinicians have integrated ambient sensors in the remote monitoring systems.
- Research toward achieving remote monitoring of older adults and subjects undergoing clinical interventions will soon face the need for establishing business models to cover the costs and identify reimbursement mechanisms for the technology and its management.
