Asan Medical, Seoul, Korea

FOURIER

Further cardiovascular Outcomes Research with PCSK9 Inhibition in subjects with Elevated Risk

MS Sabatine, RP Giugliano, AC Keech, N Honarpour,
SM Wasserman, PS Sever, and TR Pedersen,
for the FOURIER Steering Committee & Investigators

*American College of Cardiology – 66th Annual Scientific Session
Late-Breaking Clinical Trial
March 17, 2017*

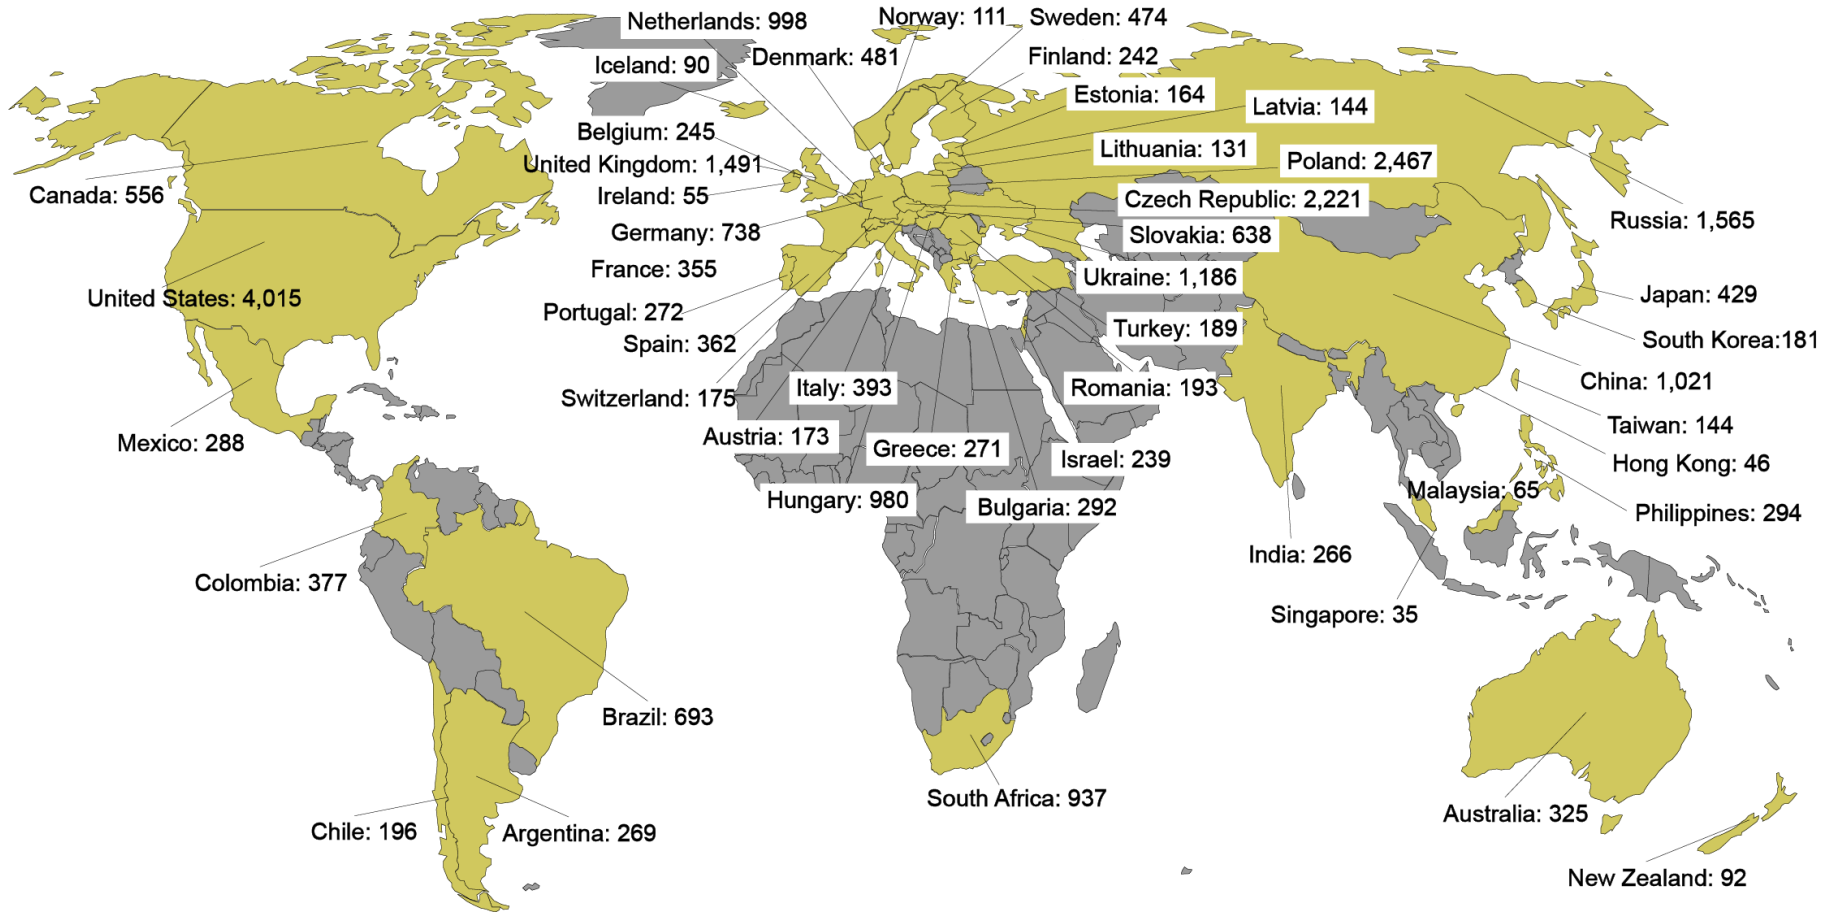

**An Academic Research Organization of
Brigham and Women's Hospital and Harvard Medical School**

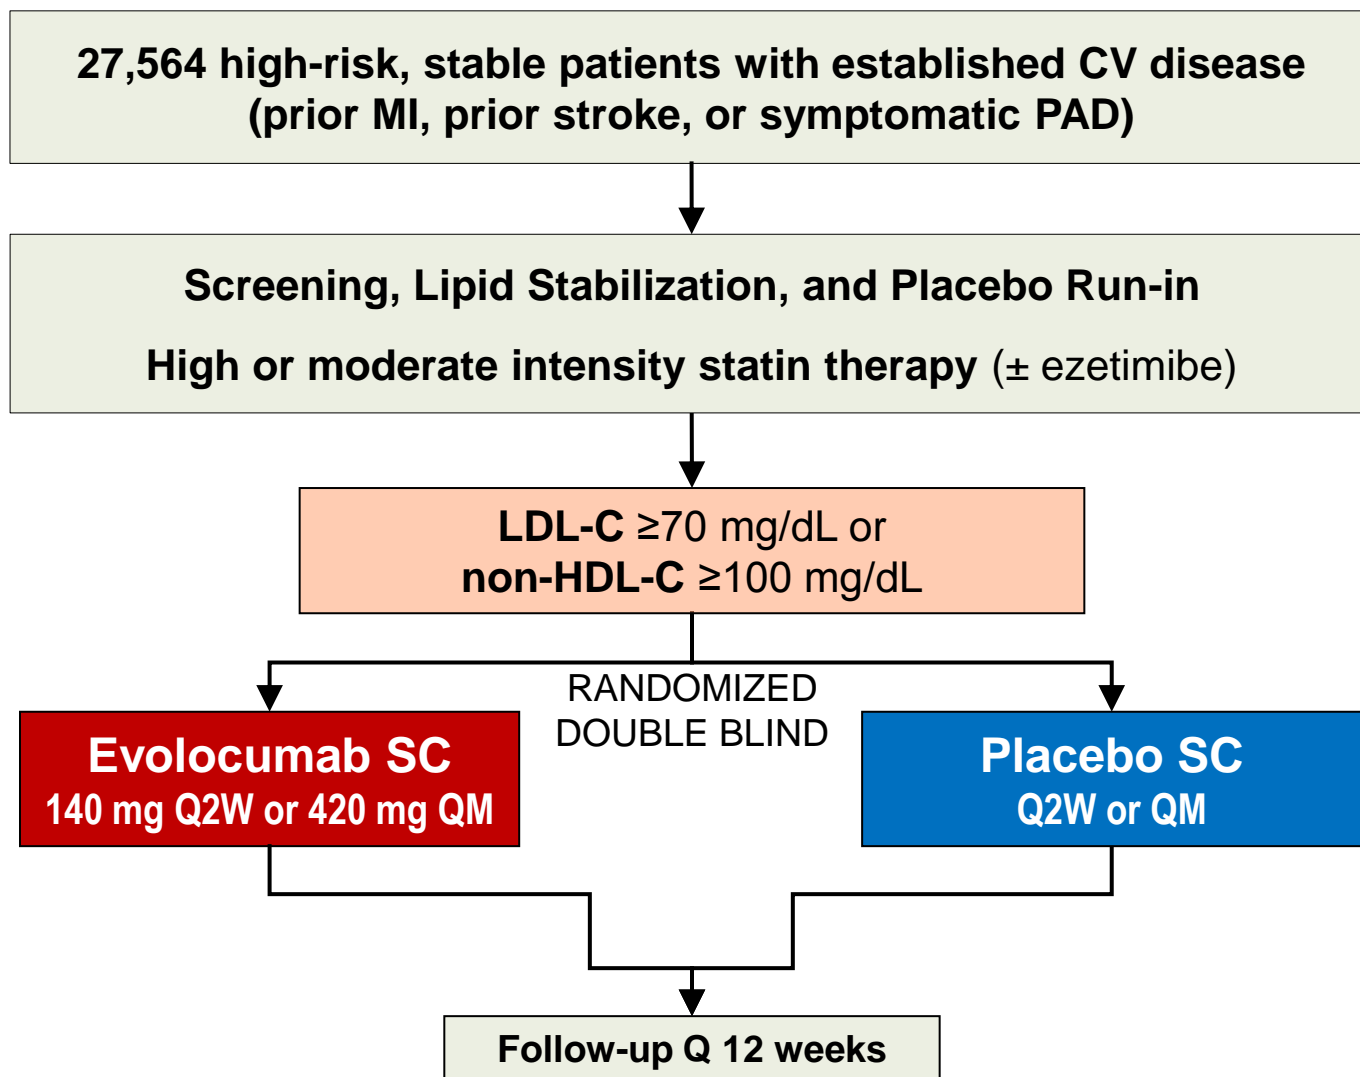

Global Enrollment

27,564 patients randomized at 1242 sites
in 49 countries between 2/2013 – 6/2015

Trial Design

Endpoints

- **Efficacy**
 - Primary: CV death, MI, stroke, hosp. for UA, or coronary revasc
 - Key secondary: CV death, MI or stroke
- **Safety**
 - AEs/SAEs
 - Events of interest incl. muscle-related, new-onset diabetes, neurocognitive
 - Development of anti-evolocumab Ab (binding and neutralizing)
- **TIMI Clinical Events Committee (CEC)**
 - Adjudicated all efficacy endpoints & new-onset diabetes
 - Members unaware of treatment assignment & lipid levels

LDL Cholesterol

Primary Endpoint

Types of CV Outcomes

Endpoint	Evolocumab (N=13,784)	Placebo (N=13,780)	HR (95% CI)
	<i>3-yr Kaplan-Meier rate</i>		
CVD, MI, stroke, UA, or revasc	12.6	14.6	0.85 (0.79-0.92)
CV death, MI, or stroke	7.9	9.9	0.80 (0.73-0.88)
Cardiovascular death	2.5	2.4	1.05 (0.88-1.25)
MI	4.4	6.3	0.73 (0.65-0.82)
Stroke	2.2	2.6	0.79 (0.66-0.95)
Hosp for unstable angina	2.2	2.3	0.99 (0.82-1.18)
Coronary revasc	7.0	9.2	0.78 (0.71-0.86)
Urgent	3.7	5.4	0.73 (0.64-0.83)
Elective	3.9	4.6	0.83 (0.73-0.95)
Death from any cause	4.8	4.3	1.04 (0.91-1.19)

Lower LDL-C Is Better

Patients divided by quartile of baseline LDL-C and by treatment arm

Comparison to Cholesterol Treatment Trialists Collaboration

Hazard Ratio (95% CI) per 1 mmol/L reduction in LDL-C

Major Coronary Events

0.78 (0.70-0.86)

Stroke

0.77 (0.66-0.91)

Coronary revascularization

0.75 (0.67-0.84)

Major Vascular Events

0.77 (0.73-0.82)

Safety

	Evolocumab (N=13,769)	Placebo (N=13,756)
Adverse events (%)		
Any	77.4	77.4
Serious	24.8	24.7
Allergic reaction	3.1	2.9
Injection-site reaction	2.1	1.6
Treatment-related and led to d/c of study drug	1.6	1.5
Muscle-related	5.0	4.8
Cataract	1.7	1.8
Diabetes (new-onset)	8.1	7.7
Neurocognitive	1.6	1.5
Laboratory results (%)		
Binding Ab	0.3	n/a
Neutralizing Ab	none	n/a

New-onset diabetes assessed in patients without diabetes at baseline; adjudicated by CEC

Summary for Evolocumab

- **↓ LDL-C by 59%**
 - Consistent throughout duration of trial
 - Median achieved LDL-C of 30 mg/dl (IQR 19-46 mg/dl)
- **↓ CV outcomes in patients already on statin therapy**
 - 15% ↓ broad primary endpoint; 20% ↓ CV death, MI, or stroke
 - Consistent benefit, incl. in those on high-intensity statin, low LDL-C
 - 25% reduction in CV death, MI, or stroke after 1st year
 - Long-term benefits consistent w/ statins per mmol/L ↓ LDL-C
- **Safe and well-tolerated**
 - Similar rates of AEs, incl DM & neurocog events w/ EvoMab & pbo
 - Rates of EvoMab discontinuation low and no greater than pbo
 - No neutralizing antibodies developed

LDL-C Reduction with Statins and CV Event Reduction

Effect of LDL-C Lowering With Statins on Cause-Specific Mortality

Reduction in CV Events Per Year of Statin Treatment

Effect of LDL-C Lowering With Statins on Cancer Incidence

West of Scotland Study: 20-Year Follow-Up

Mortality: (A) All Cause, (B) CV, (C) CHD, and (D) Non-CVD

Numbers at risk:

Placebo	3293	3185	3021	2785	2501	2203
Pravastatin	3302	3223	3069	2838	2598	2295

Numbers at risk:

Placebo	3293	3185	3021	2785	2501	2203
Pravastatin	3302	3223	3069	2838	2598	2295

Numbers at risk:

Placebo	3293	3185	3021	2785	2501	2203
Pravastatin	3302	3223	3069	2838	2598	2295

Numbers at risk:

Placebo	3293	3185	3021	2785	2501	2203
Pravastatin	3302	3223	3069	2838	2598	2295

West of Scotland Study: 20-Year Follow-Up

Cumulative hospitalizations for (A) CV disease, (B) MI, (C) heart failure, and (D) coronary revascularization

CV Event Reduction with Statins...

- is proportional to LDL-C reduction
- applies to a broad population
- is independent of baseline LDL-C
- is independent of baseline risk

LDL-C Lowering Drugs And CV Event Reduction

2016 European Guidelines

- Non-fasting blood samples allowed for screening
- *“lowering LDL-C beyond the goals that were set in the previous EAS/ESC guidelines is associated with fewer CV events. Therefore, **it seems appropriate to reduce LDL-C as low as possible, at least in patients at very high CV risk**”*
- LDL-C targets include 50% reduction; so, for an untreated very high-risk patient with LDL-C 1.8-3.5 mmol/L, or an untreated high-risk patient with LDL-C 2.6-5.2 mmol/L, the new goal is a 50% LDL-C reduction
- Consider adding ezetimibe if target is not reached with highest tolerated statin dose (2b→2a evidence)
- Consider adding a PCSK9 inhibitor for patients at very high risk with persistently high LDL-C despite therapy

Eur Heart J 2016, published on-line August 27, 2016

2014 ACC/AHA guidelines

High-intensity statin*

Clinical CVD

CHD, stroke, and peripheral arterial disease, all of presumed atherosclerotic origin

**LDL-C
≥190 mg/dL
(~5 mmol/L)**

High-intensity statin*

Moderate- or high-intensity statin[†]

Diabetes mellitus

+ age 40–75 years
+ LDL-C 70–189 mg/dL
(1.8–4.9 mmol/L)

CVD risk ≥7.5%

No diabetes
+ age 40–75 years
+ LDL-C 70–189 mg/dL
(1.8–4.9 mmol/L)

Moderate- or high-intensity statin[‡]

*Moderate intensity for selected patients

[†]High intensity if ASCVD risk ≥7.5%

[‡]Choice according to individual patient factors

Intensity of Statin Therapy

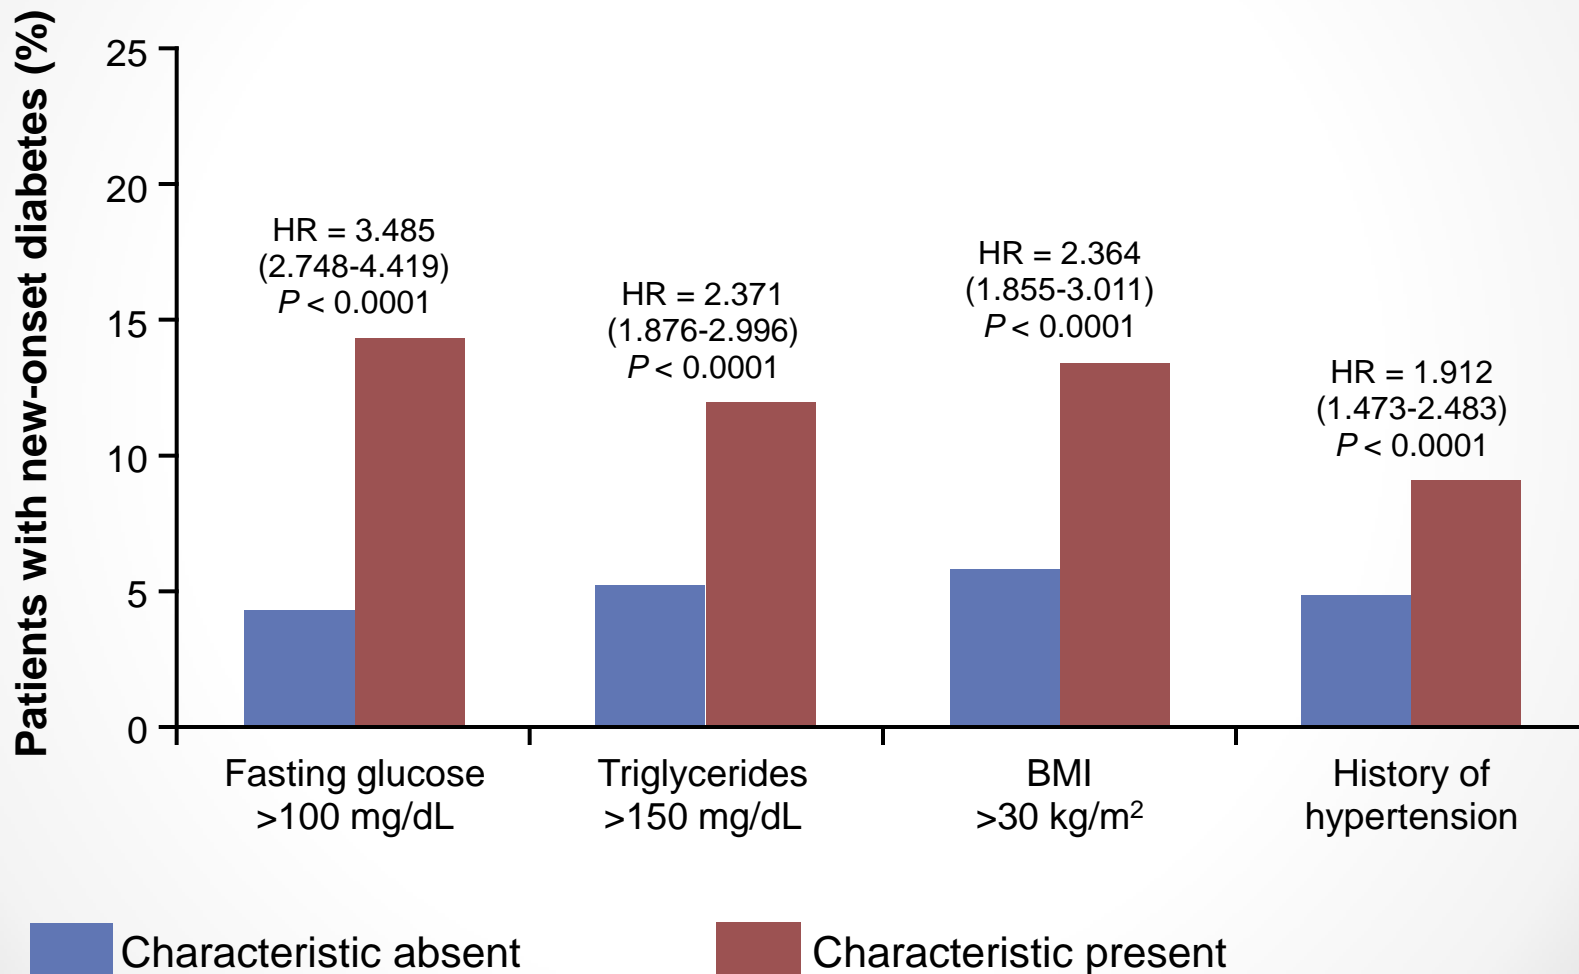

High	Moderate	Low
LDL-C \geq 50%	LDL-C 30 to <50%	LDL-C <30%
Atorva 40-80 mg Rosuva 20-40 mg	Atorva 10 mg Rosuva 10 mg Simva 20-40 mg Pravastatin 40 mg Lovastatin 40 mg Fluvastatin XL 80 mg Fluvastatin 40 mg bid Pitavastatin 2-4 mg	Simvastatin 10 mg Pravastatin 10-20 mg Lovastatin 20 mg Fluvastatin 20-40 mg Pitavastatin 1 mg

Statins in bold were evaluated in randomized controlled trials; those in italics were not

Statin Therapy and Incident Diabetes

Incident Diabetes in the SPARCL Trial According to Baseline Clinical Predictors

Side effects vs CVD Risk Reduction by Statin Tx

10,000 patients treated by
Atorvastatin 40mg for 5 years

LDL-C 77mg/dL ↓
then, 10% for secondary prevention ↓
5% for primary prevention ↓
of vascular disease

0.05% case of Myopathy
1~0.5% Case of DM onset
0.1~0.05% Case of Hemorrhagic stroke

“Concern that exaggerated claims about side-effect rates with statin therapy may be responsible for its under-use among individuals at increased risk of cardiovascular events.”

Atorvastatin: Clinical Trials

Successful Trials

AVERT - ACS

MIRACL - ACS

CARDS - diabetes

ASCOT-LLA - hypertension

PROVE-IT – ACS

GREACE - CAD*

ALLIANCE – managed care

TNT – stable CAD

SPARCL – stroke/TIA

Unsuccessful Trials

ASPEN – diabetes*

4D – diabetes + dialysis

IDEAL – post-MI**

LEADe – Alzheimer's dementia

** Mainly positive endpoints

Safety of Atorvastatin 80 mg in Clinical Trials

	Follow-up	Patients	↑ALT/AST >3x ULN*	↑CK >10x ULN*
Newman et al ⁺	variable	4,798	26 (0.6%)	2 (0.06%)
PROVE-IT	2 years	2,099	69 (3.3%)	NA
TNT	4.9 years	4,995	60 (1.2%)	0
IDEAL	4.8 years	4,439	61 (1.38%)	0
SPARCL	4.9 years	2,365	51 (2.2%)	2 (0.08%)
Total	variable	18,696	267 (1.43%)	4 (0.021%)

How Safe Is Atorvastatin in Asians?

- 67,637 patients in 55 atorvastatin trials included only 2,445 Asians
- No increased incidence of adverse events in Asians
- No case of rhabdomyolysis observed in atorvastatin-treated Asian patients
- Myalgias were reported by 2.3% of Asians (57 of 2,445) and 5.0% of non-Asians (2,235 of 44,793)
- The incidence of elevated hepatic enzymes was similar in Asians and non-Asians
- CAVEAT: only 106 Asian patients took the 80 mg dose
- CONCLUSION: safety profile of atorvastatin 10–80 mg is similar in Asians and non-Asians.

Chen J et al, from the 23rd Great Wall International Congress of Cardiology & the Asia Pacific Heart Congress, October, 2012; Beijing, China

Conclusions

- Newer guidelines (ESC, ACC/AHA and NICE) recommend that statins should be offered to a wider range of patients at risk
- High-intensity statin treatment is recommended for most patients and moderate-intensity for the rest
- Use statins to treat risk, not cholesterol
- Benefit outweighs over the harm
- Atorvastatin reduced CV events in 9 trials covering a broad spectrum of patients, and is safe at the 80 mg dose (albeit with limited data in Asians)
